

7 Air Traffic Controllers

We've all seen busy ATC towers, with controllers juggling the lives of thousands every minute of every day... this isn't really the case anymore. Computers do most of the work now, and humans only supervise. Although we may never see the end of a human in an ATC tower (to keep us passengers reassured), technology is seeing to it that the number of people will see a drastic decline for sure.

8 Bank tellers

Seriously, who goes to a bank anymore anyway? Old people? 15 years from now and most of the old people will be people who are used to using technology, and the young people will never have known another way... who's going to want to go to a bank and stand in line then, when everything you want can be done online? For better or worse, bankers are going to have to find different ways of being useful soon.

9 Simple office jobs

If you have a job being a postal sorter, a data entry "specialist", or a receptionist, etc., sadly, you better start finding a new career. These are the jobs we expect will get axed really early on in the next 15 years. Why? Because automation will

do the job with ever decreasing errors, and make it absurd for companies to hire people to do these anymore.

10 Uber / taxi drivers

Perhaps this will take longer than 15 years for India, but we certainly expect the job of drivers abroad to be under threat towards the end of the next 15 years. There is just too much R&D being done in this field, and the results are just way too promising. Machines never tire, never fall asleep at the wheel, and never

speed or drive drunk. The only driving that people will do will be for fun...

11 Call centre / telemarketeers

We're sure that each one of you has already received an automated call from some provider that was just playing back a pre-recorded message. Right? Even call centres are set to be totally automated. Almost all services try and give you an app that allows you to try and self-solve problems, this is repeated even when you call the call centre – self-serve, self-solve is the future, and we're not missing the people at all.

12 Sex workers

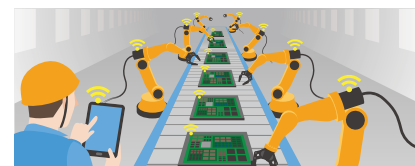

This one is going to raise a few eyebrows, but like it or not, there's a reason why it's considered the world's oldest profession. If anything, we should rejoice that it will soon be a thing of the past, as will all the evils that accompany it.

The Japanese are leading the game for this, and if history has taught us anything, the world is quick to get on the bandwagon of anything that helps it get off...

13 Assembly line employees

This one is already happening, and we expect it to get worse over the next 15 years. Machines are just better at repetitive assembly, and don't tire. There's going to be a huge upheaval in skilled but non-creative fields, and those of you still in school or college looking ahead at careers

should take serious note of all the stuff in this article. We may be trying to make it sound funny, but we're dead serious.

14 Accountants

With most purchases being done online or by swiping cards, it's no surprise that there's more transparency in all things financial. Add to this the increasingly efficient automation of accounting and book-balancing packages, and the future for accountants really does seem very bleak. Of course you can always diversify into investments and find creative tax loopholes as a consultant, but that's not something a majority of the lower level accountants can achieve sadly.

15 Interpreters / translators

With natural language processing improving a lot over the past few years, and a focus on personal assistants by all major tech companies (especially in your mother tongue), this really should come as no surprise to anyone. Computers are

just getting better every day at translation, and 15 years is a really long time in tech. We totally expect our smartphones to be capable of on-the-fly, near-perfect translation of any language to ours by 2031. 🇮🇳
