

6 Jaap Haartsen

Short range radio technology was being developed at Ericsson since 1989, with the purpose of developing wireless headsets. It was ultimately Jaap Haartsen, tasked with developing the technology in accordance to the communication protocol,

who is credited with making Bluetooth a reality. So now you know whom to thank for those Bluetooth gadgets.

7 Dr John O'Sullivan, Dr Terry Percival, Mr Diet Ostry, Mr Graham Daniels and Mr John Deane

Dr. Sullivan and his colleagues from the Commonwealth Scientific and Industrial Research Organisation (CSIRO) are responsible for discovering something that led to the development of Wi-Fi. CSIRO still receives licensing fees and lawsuit settlements for patent infringement on Wi-Fi till date.

8 Rachid Yazami, Akira Yoshino, John Goodenough

While Rachid Yazami discovered a graphite electrode that is most commonly used in present day Li-ion batteries, Akira Yoshino assembled a prototype cell that used Lithium cobalt oxide for safety. With these developments in place, John Goodenough demonstrated the higher voltage generating capabilities of polyanions.

9 Henry Cavendish

He is credited for discovering Hydrogen and weighing the earth (discovering the gravitational constant G), but he deserves credit for a lot more. Most of his work was discovered by James Clark Maxwell in 1879. They included significant theorems like Ohm's law, Dalton's law, Coulomb's law, Concept of electric potential, dielectric constant, Charles Law and many more such theorems.

10 Grigori Perelman

Clay Mathematics Institute posed seven mathematical problems in 2000, and a \$1million prize for even one solution. Grigori Perelman met the criteria to receive the prize for his work on the Poincare conjecture. He however refused the million dollars as he found it unfair. He also turned down the Fields medal in 2006, stating that he wasn't interested in money or fame.

11 Karlheinz Brandenburg

Pull out your earphones and pause that track on your phone. The person you have to thank for the most widely used music format on the internet, the Mp3, is Karlheinz Brandenburg, a German electrical engineer and mathematician. Along with this, the results of his Ph. D dissertation have formed the basis of AAC and most other modern audio compression schemes. Needless to say, he has received multiple awards in the field of technology, and our unspoken gratitude.

12 Abraham E Karem

One of the deadliest weapons in 21st century warfare, particularly in the Middle East, was developed and perfected by Abraham Karem, a Baghdad-born aerospace engineer. He emigrated to the US in the 70s, founded Leading Systems Inc. where he would manufacture Amber, which eventually evolved to the Predator, earning him the title of "dronefather".

13 Andrew Wiles

The Guinness Book states Fermat's Last Theorem as the "most difficult mathematical problem". The person who solved it, is Andrew Wiles, a British mathematician and a Royal Society Research Professor at the University of Oxford.

14 Edward Witten

The first and only physicist so far to win the Fields medal, Edward Witten's research ranges in string theory, quantum gravity, supersymmetric quantum field theories and more. He also united the five different consistent versions of string theory as different limits of a single theory, called the M-Theory.

15 Joe Viskocil

Joe Viskocil is credited with the special effects and visual effects of more than 80 films. This includes films like Independence Day, Terminator and Terminator 2, Godzilla, Armageddon and more. Sadly, before he could make the world of Hollywood movies even more explosive, this VFX veteran passed away on August 2014.
