

8 Mr. Nobody

Mr. Nobody is the last surviving mortal, 118 years of age, in a world where mankind has achieved a sort of quasi immortality. Naturally he is a sought after man, asked to recount his memories of a life on earth plagued by mortality. It's a novel premise that is made even more refreshing by the fact that Mr. Nobody recounts not one but multiple versions of his history. Making use of a non-linear screenplay to bring forward elements of a classical many worlds - many lives construct, Mr. Nobody is a deeply satisfying film bolstered by a great performance by Jared Leto as the lead, nifty visual effects, and a beautiful soundtrack. The film functions as an ode to the role of choice and randomness in life, how a small split in your timeline can lead to infinite possible futures. It's as much a visual and musical treat as it is a brave film and a worthy addition to the many science fiction installments that have tackled the subject of chaos.

9 Serenity

Much before Joss Whedon made the Avengers he made a critically acclaimed but under watched sci-fi adventure called Serenity. Following after the abruptly canceled TV series Firefly, Serenity follows the story of the crew, in particular the captain (Mal) of a spaceship - Serenity, after the arrival of a psychic occupant (River) with dangerous government secrets disrupts their way of life. The movie charts the adventures of Mal as he is involved in a constant struggle to save River from the man hired by the government to capture her. It sounds like a traditional Good vs Bad tale set in space but Whedon loads

the movies with loveable characters which remain relatable. The CGI might be garrish in places, but Serenity has its heart in the right place. It's a human story, punctuated with frequent humour and bordering on light political satire. Sometimes films with major themes can be slow, boring even, but Serenity keeps its pace brisk and strikes a fine balance.

10 Idiocracy

Probably the only sort of comedy on this list, Idiocracy is what people would call a sci-fi satire. Basically, it uses a story set in the future, throws in some sci-fi elements and ridicules current society. But not in the laugh out loud way, but in a smart, subtle and razor sharp way that famous filmmaker and writer Etan Cohen infuses in all of his projects. Directed by Mike Judge of Silicon Valley fame, Idiocracy tells the story of two people who participate in a hibernation experiment and wake up 500 years in the future only to find that idiocracy has ravaged the Earth leading to a complete collapse of cultural and social ideas that once existed. In today's World of Trump, Idiocracy is the kind of movie that shows you a bleak future and at the same time induces a weird sense of

deja vu. It's hardly a science fiction film in that sense. It derives its entertainment by making fun of its audience, extending the current state of Earth's occupancy to present a nightmarish future. In Idiocracy the Earth isn't hit by an Ice Age, Global Warming or any other apocalyptic event. Rather it's a manmade driven disease that plagues the world: stupidity.

11 Coherence

According to Quantum Mechanics, multiple realities exist but don't interact, each evolving independently from a branch point. Coherence is a film built over the foundation of this theory, called the many worlds interpretation. In this film, the passing of a comet opens up a window for another reality, allowing the characters of the movie to interact with their alternate selves. It leads to a whole lot of pandemonium and makes for a thrilling drama. The film is basically about how people react when faced with people issues but add to it the complication that comes with having to interact with alternate versions of themselves, from an alternate universe possibly, and it makes for an interesting premise. The film keeps you engaged with its gripping narrative without ever resorting to heavy handed philosophy or exposition. Coherence is a little known gem of a movie that must be on the must watch list of any film buff.
