

1 Pocket

Use this extension to save articles, videos, recipes and webpages and other links for later. Makes for one convenient extension, because any content saved goes to one place, which means you can

view it any time, from any device. For people on the go, this is a superb extension because you can access all previously saved content offline.

5 Session Buddy

A session manager that allows you to save open tabs and restore them later, this extension can potentially free up a great amount of memory and clear up

clutter if you have a tendency to keep a million tabs open at a point of time. Session Buddy also helps restore tabs if your system or browser crashes.

6 Readability

If you feel the need to zap out clutter from webpages so you can have a better reading view, Readability is a great extension to have in your arsenal. The app promises to 'provide a better way to read

online, turning any web page into a comfortable reading view right in your web browser'. Moreover, you have a few extra features such as being able to configure font color and size, and being able to save content for reading later.

2 StayFocusd

A lifesaver for those prone to wasting hours on end surfing unnecessary websites, StayFocusd works by imposing a time limit on the time spent on these websites. Once your allotted time has been used up, the sites will be inaccessible for the rest of the day. "It is highly configurable, allowing you to block or allow

entire sites, specific subdomains, specific paths, specific pages, even specific in-page content", say the creators of this genius extension.

3 ColorZilla

For most web developers, this extension comes as a gift from the heavens. If you've ever wanted to pinpoint a colour on a webpage for one of your own personal projects, with ColorZilla you can get a color reading straight from your browser. ColorZilla also provides color palettes for any site.

4 PanicButton

If you're someone who tends to browse questionable websites a lot, or spend office hours on social networking sites, then you're probably going to need the Panic Button. What this extension does is with a single click of a button (or a hotkey), you can hide all your current tabs and replace them with a custom set of tabs (blank or new tab by default). Pretty nifty if someone decides to sneak up on you.
