Google translate in app

Google translate unveiled an in-app translation feature for Android and offline mode for iOS. <http://dgit.in/translategooglex>

LeEco Le 1s Eco

phone is really good at this price range, it plays second fiddle to the Redmi Note 3, in terms of performance.

The Le 1s Eco however, has one of the best designs in this price segment. The phone's metal body feels really premium and solid. It looks good, and the fingerprint sensor on the back is easy to reach. The phone is also slim and light, making it feel even more premium for its price range.

Xiaomi Redmi Note 3

The Xiaomi Redmi Note 3 is uber powerful, way beyond its price point. But its camera

Xiaomi Redmi Note 3

pretty much belongs here. The 16MP camera looks good on paper, and it can do well in bright sunlight and well lit conditions, but images deteriorate pretty radically in lower light conditions. Under good lighting, the Redmi Note 3 produces well balanced colours, and it's really fast to focus and process images. In low lights, though, the details start deteriorating, and images aren't very sharp either. Like the Le 1s Eco, this phone also has a Samsung sensor, and it's not the best when it comes to dealing with uneven or low lights.

The Redmi Note 3, though, is one of the most powerful smartphones in the market right now, and that's across the board. The Snapdragon 650 is incredibly fast, and can handle anything that you throw at it. The Redmi Note 3's gaming performance is also really good, and app launch times are kept to a minimum. It's possibly the best phone we've seen from Xiaomi since it entered India with the Mi 3.

While the Xiaomi Redmi Note 3 isn't the best phone in terms of camera, it is still ahead of the LeEco Le 1s or Honor 5X.

Moto G4 Plus

Motorola promised, once again, that the new Moto G4 Plus has a best-in-class camera. The phone has a 16MP shooter, with both PDAF and laser auto-focus. It seems Motorola's claims are finally true this time. The Moto G4 Plus, does indeed beat both the Xiaomi Redmi Note 3 and LeEco Le 1s, and by extension the Honor 5X and Lenovo K4 Note. In comparisons we've done online, we found that the Redmi Note 3 had a better camera than the Honor 5X and Lenovo K4 Note.

The Moto G4 Plus can take sharp images in bright sunlight, and is quite fast to focus as well. When shooting close-up images, the laser auto-focus kicks in to focus quite fast. In well lit conditions, the phone is suitable for anyone looking for a good camera in this budget. In fact, we saw shades of this in the Moto G Turbo last year, but it seems Lenovo's inputs have raised the bar quite a bit for Motorola this time.

The Moto G4 Plus' weakness lies in the fact that its camera is much slower than the

Moto G4 Plus

Redmi Note 3. While the camera is as fast in sunlight, indoors and in low light, the Moto G takes more time to focus and process images. That said, the image quality remains better. In low light, images taken by the Moto G4 Plus come out brighter, and with more detail. Under indoor tube lights, the Redmi Note 3 tends to wash out images often, while the Moto G's colour representation is much better than the Xiaomi device.

In terms of regular performance though, the Moto G4 Plus is considerably weaker than the Note 3. The Snapdragon 617 is a stable and pretty fast SoC, and Motorola's enhancements do make the phone feel smooth, but it's still not the same as the Note 3. The Redmi Note 3 is nearly 40% faster than the Moto G4 Plus.

HTC Desire 828
