Android comes to PC!

Jide, the creator of the Remix OS, a desktop oriented version of Android, put their software in an AIO for the first time. <http://dgit.in/AndroidPCx>

Lenovo Vibe Shot

tube lights, the Mi 5's camera tends to wash out photos, while it loses details and shows a lot of noise under lower light. We'd choose the Moto X Play over this, when camera is of paramount importance.

The Snapdragon 820 chip on this device, though, is uber powerful. Even at the lower 1.8GHz clock speed, heat management is great and so is the performance. At the highest clock speeds, this phone barely goes beyond 40 degrees. The Mi 5 has a great display, and is compact and comfortable to carry around.

Vivo V3 Max

They sponsored the IPL this time, and have spent crores of rupees to establish the brand in India. Their first phone after all these efforts, is the Vivo V3 Max, and it is powered by a Snapdragon 652 processor. This makes it really fast. The V3 Max isn't as fast as the Xiaomi Mi 5, but it's no slouch either. From gaming to multitasking, this phone can take almost anything you throw at it.

That said, its camera can be described as decent, at best. Photos look good enough on the phone's own, but you'll realise other-

wise when you put them on a different screen. Under low light, the V3 Max suffers from more noise than phones in this price range. The Lenovo Vibe Shot and Xiaomi Mi 5 are better than this.

It can take decent photos in sunlight, but in well lit indoor conditions even photos are not quite satisfactory.

HTC One A9

Perhaps the best phone by HTC in a long time, the HTC One A9 runs on a Snapdragon 617 SoC. It's not the most powerful phone available, nor is it the most innovative. This is a phone that's all about the user experience. Barely ever does it lag, and its 3GB of RAM is enough for all the multitasking that you'd want to do.

Vivo V3 Max

The camera isn't quite the strong suit for this phone, but the A9 still has the strongest camera we've seen from HTC, yet. The good thing about the camera is that it's really fast, both to focus and process images. Under bright light, or outdoor sunlight conditions, the One A9 takes good photos, if not the best. It lacks the details that we want from phones in this price range, but it's respectable nevertheless.

It's weaker under low light, though. The white balance goes off, with whites turning

HTC One A9

somewhat blue. There's also quite a bit of noise in low light images.

LG Nexus 5X

Google's Nexus devices have never been known for their cameras, until this year. The Nexus 5X, like its bigger cousin, is amongst the best camera phones you can buy. For one, the camera is fast, and it has an iPhone-ish quality to it. That is to say that colours are really true to source on the Nexus 5X, irrespective of what lights you're clicking under. Laser auto-focus helps it to enhance image quality when shooting close-up photos.

The quality does dip in low light, and there's some noise. That said, colours remain intact, and unless you're in very extreme low light conditions, many won't complain about this phone's camera.
