Phone cams

All this is complemented by overall fast performance. On paper, it is powered by a hexa-core Snapdragon 808, but no other phone churns out the performance from this SoC, the way the Nexus 5X does. It's snappy, fast and powerful. The only downfall is the addition of just 2GB of RAM.

Another issue is the Nexus 5X's plastic body, which feels too old for today's market.

Huawei Nexus 6P

Huawei Nexus 6P

The bigger cousin to the Nexus 5X, it's easily the best looking Nexus till date. It has a full metal body and a unique design. It feels premium, and has everything that the Nexus 5X does, and more. It's powered by a Snapdragon 810, without its heating issues. The Nexus 6P performs better than the Nexus 5X, and there are few phones in the market that can beat it.

Further, if you liked the camera on the 5X, you'll love this one. It has the same 12MP sensor as the Nexus 5X, but delivers better low light performance. There's less noise, and more details, while colours remain just as good. In brightly lit conditions, you can depend on this phone with your eyes closed. The laser assisted auto-focus system is also retained.

Apple iPhone 6S Plus

Apple's best, as far as camera is concerned, the iPhone 6S Plus is difficult to argue against, as far as imaging is concerned. If you like true to source colours, there is literally no camera in the market that can do as well as the iPhone 6S Plus, with Google's Nexus 6P coming close. Further, Optical

Apple iPhone 6S Plus

Image Stabilisation helps, when shooting low light images, and the iPhone 6S Plus is one of the best in this department as well.

There is little noise to speak of, and colours look good, irrespective of the light conditions.

All this is accompanied by an A9 processor from Apple, and its famed vertical ecosystem. The iPhone 6S Plus is fast, of course, and amongst the best phones to buy today. It comes at a hefty price though, with the 128GB model going up to ₹92,000.

Samsung Galaxy S7/S7 Edge

The Galaxy S7 Edge and S7 are the best Android phones you can buy today. Samsung's flagship devices have 12MP sensors, just like the iPhone and Nexus devices.

Samsung Galaxy S7/S7 Edge

They also come with Optical Image Stabilisation, to enhance low light image quality. Samsung seems to have worked hard on its algorithms, to provide photos that many would call the best possible, at the moment.

Dual-pixel technology makes this camera almost as fast in low light, as it is in regular conditions. In addition, the S7 provides more vivid and bright images than the iPhone and Nexus devices. Where it excels beyond both the others, is in low light performance. The Samsung Galaxy S7 Edge is the best smartphone for low light imaging today.

Further, even the Exynos 8890 variants of the Galaxy S7 and S7 Edge, are really fast. We wish Samsung would bring the Snapdragon 820-powered versions to India, too, but there's no reason to complain right now. The Galaxy S7 has 4GB of DDR4 RAM, along with UFS 2.0 storage, making it one of the smoothest and fastest smartphones in the market, and the fastest Android phone to buy.

BEST BUY Moto X Play

When camera and budget are the most important factors, the Moto X Play should be your pick. For its price, the device shoots really good photos, and can beat even phones priced well over it. For example, the Moto X Play's camera is much better than the HTC One A9 and even the Xiaomi Mi 5.

BEST PERFORMER Samsung Galaxy S7

Between the Galaxy S7 and iPhone 6S Plus, the basic difference is in the fact that the former provides warmer images, to the iPhone's more true to source colours. To many, these warmer images will look better than what the iPhone provides. That said, the reason the Samsung Galaxy S7 comes out to be the best performer, though, is that it's visibly better under low light. Not only is it faster, it also takes brighter, and better quality photos.

EDITOR'S PICK Apple iPhone 6S Plus

While the Samsung Galaxy S7 Edge/S7 may be the popular choice, Apple's true to source colours can't be ignored. The camera is fast, takes good photos in all light conditions, and the performance is beyond question. It is hence, the Editor's Pick for this comparison.
