All the latest lifestyle technology, gadgets to drool over and gizmo porn like never before. Desire, Greed and Temptation ahead...

**Lazer internet?**

Facebook has detailed a way to give lazer based internet access digit.in/FBlazer

✉ This month's mag was absolutely needed, as I am going to start my college life now. The mag is going better than ever. The Swift 2 Fast Track was not in my interest area, but as you have always said, you shouldn't be biased. I am not much of a hardcore gamer, but as I didn't see SKOAR first, I admit, I was a little baffled, but soon I found it. The last time I wrote to you, I had submitted some complaints. This time I'm going to focus on suggestions because I'm sure you are working on those complaints and I understand they need some time to implement.

Some 'original' suggestions (I hope):

1. If you provide videos in the DVD, perhaps you could also include fps rate. Some videos shatter as they can't be played on my computer.
2. You could provide a Fast Track on creating, hosting, and maintaining your own website? I can help as well since I've created a few sites on my own.
3. You could allow a fully crowd-sourced Fast Track on any topic.

I agree with what Jayesh sir says in his columns.

Regarding "5 times space shocked us", I have "5 questions for when space totally shocked me":

1. Where is the universe itself?
 2. Doesn't cosmic background radiation get distorted by galaxies, pulsars, quasars?
 3. Don't other star systems (apart from binary ones) gives observable gravitational waves?
 4. Ain't there any chance of iron based martian life (like ours is Carbon based)?
 5. Could we ever decipher alien signals, even if accidentally observe then?
- That's all for now, guys.

—Saksham Sneb Mandal

■ Sure, we'll add the FPS information in the video descriptions in the DVD UI. Additionally, you can even browse it in Windows Explorer, right click properties and check FPS, data rate and other details.

We've done a couple of FTs in the past which cover web hosting and other aspects of setting up your own website (eg. Cloud Services in Oct 2013 and Word Press in Oct 2010) but you're right, things have changed and perhaps it's time to take another look

Feedback for the July 2016 issue of Digit

at the topic. Funny you should mention a crowd sourced Fast Track. We actually tried the exact same concept back in 2009. It was called Digit OSP (Digit Open Source Project) and aimed to create the first ever community developed FT, but it didn't catch on as we had hoped.

As for your space related questions:

The Universe is everywhere. It's all around you, in every direction. We don't know if it's finite or infinite, but it goes on for further than we are able to detect. If you're asking what the universe is contained inside, or what is outside the universe, as far as we know, there's no "outside" of the universe.

The Cosmic Microwave Background (CMB) comes from everywhere, because everywhere was once a part of the Big Bang. It's hard to "distort" something that comes from everywhere. Plus, it's so old that it's red-shifted more than anything else.

We didn't detect gravity waves from binary stars colliding, we detected them from binary black holes colliding! Theoretically everything gives off gravity waves, but it's so faint that we can, as of yet, only detect them when super-massive monsters like blackholes collide!

I've never heard of anyone suggest iron-based life before. Carbon and Silicon are the usual choices because of how reactive

they are with other elements, and because of how they can form complex molecules (very important for "life" as we know it). That said, anything is possible, it's just not very probable.

We may not even know if we are looking at alien signals to be honest. I guess we would at least be able to tell an alien signal when we found one. If the alien life form had kept the message ultra simple, and very basic – like the message we attached to Voyager. Then yes, I think we would be able to decipher it. (<http://voyager.jpl.nasa.gov/spacecraft/goldenrec.html>)

—Robert

✉ Hi Team Digit!

I got introduced to Digit last year in my school library. At first the magazine bored me but as time went by my interest grew. The first edition that I purchased was the Appsutra April edition. Now I purchase your dgt 'veda' every month and get updated with technology mantras. I liked your June special edition because the 15 anniversary edition is dedicated to 15 tech revolution.

Your 'Back to school' edition is helpful in my graduation years because I just finished my 12th standard this year.

Some suggestions:
