

Gaming is now becoming such a ubiquitous activity that restricting it to just one device or platform does not make sense.

Increasingly you will see games which are device agnostic, platform agnostic and following a single Unicode.

much an essential now. The age at which people are exposed to such devices is also shortening rapidly. Children as young as five have smartphones and pads in their hands.

As our internet connections get better and more reliable, we'll start relying more heavily on cloud computing. Cloud usage is already actively happening all around the world and we use it on a regular basis. Cloud Gaming will play a key role when it comes to the future of gaming. All we do right now is store our saves and achievements and

stuff on the cloud which enables us to pull them from anywhere, so you can continue where you left off without needing to physically carry your save files around. However, in the future we could possibly store entire games on the cloud. We won't need to download the game on to our systems at all, and with the size of games these days, think of the space you'll be saving. What we're getting at is we won't have to deal with updates at all, there will be one updated version on the cloud and all we'd need is a stable internet connec-

tion to access the game. Another advantage is that games should in theory become cheaper. Think about it, they won't need to physically distribute the game or spend on packaging and such. Cloud computing is progressing pretty fast so hopefully it won't be long before Cloud Gaming is a reality.

Now on to Xbox's Play Anywhere. It's ambitious, it's huge, and if they pull this off, there'll be a lot of happy gamers. This is especially good news for PC gamers, so it's no surprise that we're really excited about this one. If you haven't been following E3 or don't quite know what Xbox Play Anywhere entails, simply put, Microsoft wants to merge or combine all their platforms. ALL of their platforms. Basically, all phones, PCs (which aren't Macs), Xbox Ones, and any other device that runs Windows will fall under Xbox Play Anywhere. Everything will use Xbox Live. The great thing about this is PC gamers will now have access to otherwise Xbox Exclusive titles like Forza and possibly even Halo in the near future. Microsoft have already planned a slew of Xbox One and Windows 10 exclusive titles including the likes of Gears of War and the newest Forza. But it doesn't end there, you now only need to purchase the game once, either for PC or Xbox, and you can play it on both, your saves, achievements,

Cloud gaming is the future. Not just syncing scores and progress across devices, graphics processing too will be handled by the cloud in the near future.
