Feature

utes, that even kids began to use cameras everywhere. In fact, there has been an ongoing debate regarding the actual skill needed to work professionally is lesser as compared to the same for a film-dependent camera.

with more focus being laid upon catchy openings and clickbait type titles online.

### You don't feel nostalgic when you play Mario, Dave, Contra or pretty much any 8 bit game

You know you want to fire-up that old arcade machine!

As a whole, we have come from one group photo on a birthday to ten-twenty clicks on each trip to the mall. If you find it difficult to digest that there was a time when you "could" actually take just a few pictures – hey there millennial!

### Your attention span is as short as Bhai's time in jail

It is no secret that the average human attention span has decreased since the dawn of the millennium. Studies conducted in 2000 resulted in the conclusion that the attention span of an average person is 12 seconds, quite close to that of a goldfish at 9 seconds. Guess what has been the result of a similar study conducted last year? 8 seconds. Yes, on an average, we now pay lesser attention to things than a domesticated freshwater fish the size of your thumb. This is perhaps one of the traits that has spread much further beyond millennials. It might not be as bad as it sounds, because studies have also revealed that millennials with shorter attention spans are actually better at multi-tasking, thanks to their constant urge to switch between apps, screens and preferences. This phenomenon has also influenced content creation in a big way,

Millennial or not, if you don't know what Mario is, you're probably on the wrong magazine. That aside, there are two types of Mario players - the ones who have played it on an arcade machine and the others. If firing up an 8-bit game doesn't fill you with pride and nostalgia, then you were probably born on this side of the millennium. For others, if you see someone cringing at an 8-bit game, or vehemently arguing that the Xbox's and Playstations were

actually the first consoles ever, do not let them partake in anything that requires them to be an actual adult. On the other hand, if someone knows that shortcut to the negative level on Mario, you've met a co non-millennial.

### You don't remember using Windows 98

There was a time when looking at screensavers on a computer used to be a legit way to pass the time. If you agree, you've probably been around for a while and have experienced Windows 98 first hand. From the screensavers (the maze, haunted house, pipes etc) to the joy

All hail pipes! Don't ask what they contain though. That's a secret!

of playing the original Doom, Half-Life and more such classics, Windows 98 was the best we could have asked for when we had it. If you do remember Windows 98, then probably the errors and bugs make you feel nostalgic too. On the other hand, you're from beyond the 2000s if the first Windows you experienced was XP. The closest you can come right now to experiencing Windows 98, without much hassle, is via <http://dgit.in/Win98Emu>

### You've never rented movies

When the new blockbuster hits the cinemas, if you have only hit the download button for as long as you can remember, you're definitely a millennial. Renting movies from local libraries, or more a shady rental place more likely, used to be a big deal back in the 90s and even the early 2000s. Affordable high speed internet is quite recent and in its absence, these rental places used to be the mecca

of entertainment where you could browse through the catalog for hours and choose one specific DVD. That is, if you were lucky enough to have a DVD Drive on your computer or a DVD player at your home.

Yes, phones that looked like this were common in every home!

### You've never heard the dial tone

Always used to the calling beep being the first thing you hear when you make

a call? Let me tell you about what used to happen before cell phones arrived. There used to be phones fixed to a place due to wires (Yes! The horror!), which, when you picked up the receiver, filled your ears with a dull tone that indicated that your phone was waiting for you to dial a number with the physical buttons. Landline phones have become a rarity now and almost nothing apart from commercial establishments and offices have them. In fact, when internet was of the dial-up kind, it used to rely on this very dial tone being available (as in, the phone being connected to the network) to be able to gratify you with the blinding glory of 64Kbps. Ah! Those were the golden days.
