

e-Kick

Do you have memories from your childhood of riding and dragging your feet on an urban scooter? Well, if you don't and even if you do, the e-Kick is here for you. Made in collaboration between Peugeot and Micro Mobility, the scooter will run on battery to a maximum range of 7.5 miles. Started as a bicycle maker, the company already has a lineup of vehicles other than the regular ones, and the e-Kick is just another new type to their list. It wasn't a standalone release and it was unveiled along with Peugeot's 3008 crossover SUV. The SUV has a special docking station in the boot space to charge up the scooter. And you have guessed it right, the e-Kick is a battery-assisted vehicle that can reach up to 15 mph with the electric motor powering the rear wheel. It doesn't come with proprietary connectors and you'll be able to charge the scooter through a regular power socket, capable of fully charging in an hour. The scooter will be easy to transport since it can be rolled down to its front wheel and you wouldn't have to carry it with you.

This electric scooter will be sold in the final quarter of 2016 by both Peugeot and Micro. There are a number of major innovations in this product, like the "Motion Control" electric assistance. While you still have to push it yourself, the scooter optimizes the amount of electric assistance based on your movements. The onboard foot break has a regenerative braking system which charges the battery each time you apply braking force for that little bit extra juice for the last mile. Also, due to its innovative design, the user can even pull it in its folded state when it is not in use. As of now, there are no pricing details available.

Intelliboost RG600

There are some gadgets that you have to own. And as for car owners, you should definitely check out the Intelliboost RG600. This little device packs in a lot of power literally, big enough to jump start your car and inflate your flat tire. It's a lithium ion battery that will also be able to charge your laptop or any Android or iOS device through two USB ports with an output of 2.1A. Housed inside a durable enclosure, it's capable of withstanding extreme conditions of heat and cold. You'll also find a display screen on the battery to check the battery percentage. Along with that, there's a really bright LED on

the device that sums up all the features offered. It ships with several accessories such as mini-jumper cables, an air compressor, a universal charger for mobile devices and a car charger. The charger cables will support almost all types of port sizes for laptops and smartphones as well. It's quite safe and easy to use the device, where if the jumper cables aren't connected according to the correct polarity, it won't work. You will be able to simultaneously charge multiple devices with the huge 15,000mAh capacity. Imagine replacing those huge jump starter kits with this little multi-purpose device.
