

NES Classic Edition

Nintendo has something to make a lot of people around the world nostalgic. Do you remember those glorious days of your childhood when you were hell bent on helping a plumber find his princess in some castle? Video games have been a big part of our lives where Nintendo's NES console was the most popular one out there. And now, after quite a long time, the company has announced a new NES console, which is also compatible with the current technology in a tiny form factor. The new console is small enough to be carried in your pocket. It follows the same design from the original version along with their iconic NES controller, and it still plugs into the console using their own proprietary connectors. You will be able to hook it up to a monitor or your TV using an HDMI cable while the new controller is capable of connecting to a Wii Remote. The console is cartridge-less and comes with 30 games built-in. Some of the popular games included, that probably took over your childhood, are Donkey Kong, Final Fantasy, Galaga, Pac-man, Mario etc. The Classic Edition is set to release on November 11 this year and it has been priced at a surprising \$60, or an approx ₹4,000. We don't know about the kids, but a lot of adults will definitely be buying this console for themselves, just to relish their childhood days.

Spector

Has it been a frequent occurrence when you come across a wonderful font and have a hard time trying to find out its name? Although it's easier to discover the font from web pages, but you would need someone with an eidetic memory to recognise fonts in print. Well, someone has addressed this huge pain by building Spector. It's a device that scans and recognises fonts while being able to determine the CMYK or RGB values as well. All you need to do is place the device over the text and with the press of a button, the camera inside takes a picture. Then it goes on to match the image with a font database wirelessly. The database isn't big enough nor is the project itself. The data is stored on the device which can be pushed to Adobe InDesign by installing a custom plugin. It is still in its prototype stage, as Fiona O'Leary created Spector as a graduation project with no plans of commercialising, yet. Once the database is expanded with more fonts and connectivity is improved to support more devices and software suites, this device surely can expect huge success in the field. After all, identifying fonts with just a click sounds so convenient. In simpler words, this is Shazam for fonts.

Teal

Drones have become mainstream and now, the race is on to build the fastest and the most powerful one out there. Speaking of powerful drones, there are variants capable of carrying humans but for the title of being the fastest, we might have a new winner. Meet Teal, a crazy drone that can flip, dive and do barrel rolls while speeding at around 85 miles an hour. Packing the powerful NVIDIA TX1 chip, it can handle several advanced technologies such as autonomous flight, image recognition, machine learning, etc complete with guidance systems to navigate. The drone is expected to start shipping at the end of this year with a price of \$1,200 (approx ₹80,000). This drone is not only quick with its blades but it will be capable of handling winds of up to 40 miles per hour and endure other harsh weather conditions such as rain and snow. It will carry a mounted camera to capture 4K footage at 24 fps.
