

Omega2

The Omega2 is a hardware development platform that enables pretty much anyone to get into hardware development. The Omega2 is simple, which is great for those just getting started on hardware development. Additionally, the \$5 price tag also greatly helps that very aspect. The Omega2 is tiny, just 1/4th the size of the Raspberry Pi or less than a 1/3rd of the Arduino Uno. With the Omega2, you don't have to worry about buying additional WiFi dongles or having to install an external OS. The Omega2 comes

with integrated Wi-Fi support and on-board storage as well, so it's ready to go as soon as you power it up. Despite its size, the Omega2 is a full computer which runs Linux. Those of you who use Linux or are familiar with it know what it is capable of. Omega2 can be programmed with whatever language

you want, so those who are new to hardware development can stick to whatever language or libraries they're most familiar with. Additionally, it's integrated with the Onion Cloud which lets you control it remotely from anywhere in the world through their Web UI or RESTful APIs. A few of the things you can do with the Omega2 are home automation, music streaming, networking related stuff, robotics, and learning to code among other things. It's a good time to be a tinkerer!

CTRL

CTRL is the solution to fast-changing light conditions. These tint changing glasses are your answer, no matter what the light conditions are outside. CTRL claims to be the world's most advanced and fastest tint changing glasses. They've been redesigned with new colour options and a full frame. CTRL XC incorporates the improved e-Tint technology which is capable of changing tints within as little as 0.1 seconds depending on the surrounding light. This can be done both manually or automatically, making the CTRL the ideal sunglasses for any light condition. Older tech such as photochromic sunglasses are passive and adapt much slower – they can take up to several minutes to adjust – and they can't be controlled manually either. Electronic Tint-on-Demand (e-Tint) liquid crystal tech however, is much faster and manually controllable, even the Army is looking to incorporate it into their standard issue eyewear.

Bagel

The Bagel claims itself to be the only tape measure you will ever need. With the Bagel, you can measure anything. The Bagel is the world's first smart tape measure. It comes with three different modes which are easy to use. The three modes included are String Mode, where you can measure lengths like you would with a traditional tape measure. The included string measures around 3 meters. Wheel Mode is the second mode wherein you can use the wheel in the Bagel and simply roll the wheel to measure distances. This is especially useful on curved surfaces. The last mode is Remote Mode where you simply point the ultrasonic sensor present within the Bagel at objects and it will tell you how far away it is. Additionally, the Bagel comes with several other useful features such as being able to save data and voice, bluetooth connectivity, and its very own mobile app.
