

7 technologies वोल्बान्ड INDIA WILL DOMINATE BY THE YEAR 2030

With every new dawn, India is proving it's excellence in a new industry and very soon, we will be the best at quite a lot of things

terms such as 'rising elephant' and 'emerging superpower' sound really nice, but how much truth is there to such claims? In order for this to be true, we'd have to globally dominate at least a few industries in the future. Here's our list of seven such industries that we think India has the potential to dominate.

1 AUTOMOTIVE TECHNOLOGY

The automotive sector in India is about \$74 billion now, and expected to grow to \$300 by 2026!

The Automotive Mission Plan (AMP) drafted in 2006 aimed to promote auto manufacturing in the country. The first phase was implemented between 2006 to 2016, and looked at economic growth, stability, passenger comfort, quality and cost competitiveness. The second phase is expected to be drafted only by the year end,

Getting on the high road

but projections of AMP 2016-26 put India among the top three automotive manufacturing hubs in the world. India is unique in the sense that everything from the cheapest car in the world to the most expensive are all available here, and this diversity of consumers means that we have a unique edge over the rest of the world.

2 VFX

It's ironic that most Bollywood flicks don't have the greatest special effects, while Hollywood movies do, and yet most of the Hollywood effects are outsourced to Indian VFX studios! *Life of Pi*, *Skyfall*, *Avatar*, *Lord of the Rings: The return of the King* and *Madagascar 3* are just some of the movies who have an Indian hand in their making.

V Srinivas Mohan, the visual effects designer of *Endhiran* and *Maattraan* amongst others, told a newspaper that of the 400 odd VFX and animation firms in India, only a dozen are involved in creative work while the rest are just cheap labour, doing rotoscope, wire removal, match moving and keying. Instead of being upset by this, we see this as an opportunity for growth. Because VFX is a valid profession now, even more people are getting into it, and that means a bigger upcoming talkent pool, which is surely going to yield more VS Mohans, and thus increase the quality

Panache on screen

of work done here. Mohan himself is excited because with the right initiative by the government, India can become a global VFX and animation hub by 2025 or so.

3 TELECOM

It's no secret that we are one of the biggest telecommunications markets in the world already. When counting mobiles and landlines, we're only behind China in terms of numbers, but hold much more promise because of our more open industry. We also have some of the lowest call tariffs in the world because of competition. When it comes to internet penetration, we've only connected a little above 300 million people, and that number can easily double, potentially.

Consider that most of the places connected via phones don't even have roads, and you can see how companies have developed very specific expertise that those
