

PRIVACY AND SECURITY

The minute any individual or organisation (be it private or public) gets on the internet, we no longer are part of any geographical jurisdiction. We all become "Internet Citizens". So, wherever in the world you are operating your device from, you are susceptible to cyberattack or cybercrime. We at Kaspersky, believe that the "Public-Private Partnership" is very important to tackle this menace. Government bodies should use technology and threat intelligence from leading IT Security organisations, who have a global perspective to tackle the ever increasing threats.

In India, the adoption of devices under the Internet of Things (IoT), or as we call them "Connected Devices" is increasing rapidly. At this stage it has become very important for users to be aware that the chance of them being attacked or compromised is higher. Going forward, we at Kaspersky believe that this is going to be a bigger problem if we do not use security technology to address it at the planning stage itself. This is why we urge manufacturing companies to consider security at the planning stage when they develop any smart technology. This will help protect all of us users, and make us more prepared for such eventualities as our smart devices being controlled by cybercriminals."

– ALTAF HALDE

Managing Director - South Asia, Kaspersky Lab

AVOID INFORMATION CLUTTER

While the industry has made significant & consistent efforts to optimise communication channels across India, there is still a need, as well as scope for increasing awareness around the clutter of 'everyone trying to reach everyone'. As we evolve to a more connected society, one can easily compare the similarities in the nature of ever-increasing traffic on roads and highways to that of the traffic on our growing telecom and data networks. It is now more important than ever for people to find ways to optimise their time by avoiding unwanted communication wherever possible by using readily available technology. India is using smartphones to reshape the way we communicate and engage with various communities."

– KARI KRISHNAMURTHY

Vice President, Growth and Partnerships, Asia & Country Manager, India at Truecaller

ENABLING PEOPLE WITH SPECIAL NEEDS

People with special needs are often the ones who need our love and attention the most. As the use of mobile devices such as smartphones and tablets grow, the number and complexity of mobile websites and apps has increased. Mobile devices have also become more accessible to many users with disabilities. While all mobile content should be accessible to the widest possible audience, including people with disabilities, to date, accessibility standards have focused on particular areas of mobile phone use only.

There are studies which suggest that digital devices such as smartphones and tablets can go a long way in helping people with intellectual disabilities face up to the stigma of their condition. By using apps to create videos that explain their life experiences, they can become

more self-empowered while demonstrating and teaching their skills to peers. There are innumerable ways in which people with disabilities can be helped to lead just as much a normal and fulfilling life as a fully-abled person. Technology has progressed to an extent wherein now smartphones have specially been developed for people with complex medical conditions including spinal cord injuries, amyotrophic lateral sclerosis (ALS), cerebral palsy or other disabilities that affects the use of hands and arms."

– VIKAS AGARWAL

General Manager, India, OnePlus

INNOVATE AGRICULTURE

Given the importance of the agriculture sector, a key technology, which could revolutionise yield of even farmers with small land holdings, is the Israeli Technology of farming. Only 20% of the land area in Israel is naturally arable, but the country yet manages to meet 95% of its own food requirements. Another report suggested that agricultural production in Israel rose 26% between 1999 and 2009, while the number of farmers dropped from 23,500 to 17,000. Farmers have also grown more with less water, using 12% less water to grow 26% more produce. This is quite significant and if assimilated well, would be a game changer for a country like India. Diverse technologies like vertical farming, drip irrigation and soil solarisation need to be brought into the country so farmers can produce better yield while maximising profits.

Technology has a significant role to play in the future of prevention, diagnosis and treatment of ailments in a country like India. Usage of nanotechnology in cancer treatment has the potential to do better drug targeting leading to maximum impact. As per a report by Goldman Sachs, deployment of IoT in the healthcare industry could result in nearly \$305 billion in savings for the industry in the near future. The most interesting outlook, which has been foreseen, is a connected bathroom. With the power of the Internet, the consumer could be more empowered to gain access to greater knowledge as to their current state of health leading to advance diagnosis and improved prevention. The technology and the Bill of Materials for such a deployment may not be prohibitive, but will have a key impact on early diagnosis of household occupants as a whole."
