Introduction

When we get down to the basics of life, survival is the name of the game. We want to live as long as possible, against as many odds as possible. It is towards this end, we have continued to make and measure 'progress'. Sanitation, medication, technology, they are all humanity's weapons. It's us against the world, and the enemy boss is invincible.

The Enemy

Any Taoists or other enlightened minds in the house may immediately point out that the reality of the situation is more like 'Us in the World'. This could be extended to 'Us is the World', but now is not the time for philosophy. As far as humans and our approach is concerned, disease is a dreaded enemy that must be defeated by any means necessary, which most often is, destruction. Disease is basically a significant deviation from homeostasis, the equilibrium of various physiological processes that consti-

tute the normal functioning of a healthy human. This occurs mainly in two ways, either our body is inadequately capable of handling the environment, or something has infected, and is messing with, our body. This 'something' is most often another life form, be it a virus, fungi or bacteria. It's creating a problem, and our basic reaction to problems is "Kill!", which is why our bodies have an immune system. Basically, the immune system unleashes vast armies of antibodies in response to certain antigens, which are like molecular markers
