

SELF-LEARNING SOFTWARE

Adding on layer after layer of technology, the gadgets of the future will be able to teach themselves, thanks to smart sensors, innovation, big data and automated intelligence. Is it safe to say that every enterprise application will be self-learning at its core?

published by Vanity Fair, Tinder took to Twitter to unleash a rant about the impact it has had on society. The tweets soon went on to become a laughing stock for the Twitterati, and became labeled as an "overreaction" by the company.

Tech stories are often incomplete without the giants in the world of electronics, and Samsung plays a major role here. Back when the Samsung Galaxy Note 4 was launched, one particular ad relating to the product aimed to portray it as a "super organised secretary" with a "sexy short skirt". The ad was pulled off YouTube before it could go on to create a storm, and whether or not it would have remains debatable to this date. Somehow,

on this note, we can only wonder how prime issues like sexism at the workplace and the likes could have pulled Samsung into the echelons of an unwarranted argument. The ad was removed before it could even hit the public outrage charts, but it still managed to be picked up by Cnet.

Airbnb is no stranger to offended individuals either. Last year, when it finally paid up taxes in line with San Francisco's hotel laws, it published an ad that said, "Dear Public Library System, We hope you use some of the \$12 million in hotel taxes to keep the library open later. Love, Airbnb." The ad was deemed in bad taste and led to a general outcry by many local residents of San Francisco, leading to it being pulled

off of bus stops and billboards. Airbnb still went on to win its political battle, but not without leaving behind a naive one-liner that was far from witty.

Topping this list is the online discount coupon vendor Groupon, which is now branded NearBuy. Back in 2011, the company paid \$3 million for a 30-second ad slot at the Super Bowl, only to put up an ad that made regrettable humour of Tibet's refugee crisis. "The people of Tibet are in trouble, their very culture in jeopardy. But they still whip up an amazing fish curry. And since 200 of us bought on Groupon.com, we're getting \$30 worth of Tibetan food for just \$15," stated the ad, opening up widespread disgust, cries of the company being insensitive and a massive flare across social media that ultimately led to the company withdrawing the ad and issuing an apology. "The team had turned

off the part of our brain where we should have made our decisions," stated then-CEO Andrew Mason. We cannot help but agree.

There have been many more such incidents in the world of advertising by technology brands, but the immediate memories that these incidents spur are relatable, and certainly very regrettable.

Unfortunately, these stories will linger around for a while, and at this point, it's become a cycle of sorts. On the plus side, we can still derive some fun from watching big brands screw up.
