

VLC

Recording your Desktop

Here at Digit we often need to record our screens for various reasons, be it recording gameplay or tutorials. At times, the screen-recorder you are using might cause problems due to various reasons - ranging from slowing down your PC to not providing a sufficiently smooth recording. So instead of trying a truckload of options after scouring the internet for recommendations, try using VLC's screen recording feature. Needless to say, there is the added bonus of VLC being a well known software.

Parameters for screen capture

Steps to Follow

- Navigate to Media > Convert / Save
- Under Capture Device, select Desktop on the Capture mode drop down menu
- Choose your desired frame rate in the Desired frame rate for the capture menu
- Click Convert / Save
- Select your Codec and destination for the file.
- Click on Start to start recording and then click on Stop when you're done.

VLC	39
Elder friendly smartphone tips	41
Pokémon Go	43

{ Tips & Tricks has its own page numbers, and does not follow the rest of the magazine's page numbers. This is done to ensure that you can cut out and save T&T in a separate folder for later reference. }

Tip - Use 'WebM' Codec to obtain the best quality videos with comparatively less file sizes.

Recording your Webcam

A major portion of all the videos on Youtube are actually recorded through webcams or from a webcam perspective. But not everybody has a laptop with a good webcam, or even a separate webcam for that matter either. In such situations, we often end up downloading third party webcam recorders which come with their own host of problems - be it security, or quality tuning. Why not use a trusted software you have already been using for a while now? You can use VLC media player as a webcam footage recorder by following the steps below.

Steps to Follow

- Navigate to Media > Open Capture Device or Press "Ctrl+C"
- Select DirectShow from the Capture Mode dialog box.
- Make your selection in Device Selection Box.
- Click Play > Click on the Record button.

Remote Control VLC From A Browser

Quite often, you might be running music on your PC or Laptop while you are moving around the house. Now, if you need to change the track, pause it or interact with the playback in any way, you need to go back to the system, which might be in a different room entirely. If your media player of choice is VLC, then you may not have to go all the way yourself. VLC allows you to control the interface from a browser which can be from your laptop or mobile. Just follow these steps.

Steps to Follow

- Goto Tools > Preference

Settings to allow VLC to be controlled remotely from a browser

- Select All from the Show Setting. (You can find this to the bottom left of the menu)
- Go to Interface > Main Interface>All>Check Web and Lua Interpreter
- Again, go to Interface > Main Interface > Lua > Set Password
- Now ensure that there are no web servers running on your machine and type `http://localhost:8080` in your browser.

Add Effects To Your Video and Audio

A lot of us take VLC for granted and many don't know what this software is capable of. For example, did you know that VLC has a host of Audio and Video effects and filters to let you alter your media experience in a number of ways? Starting from image manipulation to geometric alignment and even advanced options like Anti Flickering, Motion blur and more are available at your disposal. Trust us, you've seen nothing until you see the Game of Thrones opening sequence with the Psychedelic, Mirror and Water effect on simultaneously.

Steps to Follow

- Goto Tools > Effects and Filters.
- You will find separate tabs that will have Audio and Video manipulation tools.
