

Adding a logo or text overlay to a video is quite easy in VLC

Example - Image adjust in Essential tab under Video can be used to set brightness, hue etc.

Add Watermarks On Video

Unless you have a dedicated video editor on a really powerful PC, you probably are banging your head on the desk about adding a watermark to your video. Maybe not, but wouldn't it be neat if you could just rely on good old VLC for that? There is a trick to make it work. Follow the steps below to add an overlay on your video, and use the screen recording feature that we shared earlier to record the playback with the overlay. Voila! You now have the same video with a watermark.

Steps to Follow

- Go to Tools > Effects and Filters
- In the Video Effect Tab, go to Overlay.

If we could actually make GoT episodes, we'd make them sooner!

Note : You will have to record the video with the logo and save it as a new file.

Download and Add Subtitles

Downloaded movies and shows are not always of the best quality, with improper audio or even sections without audio. Unless you are a stickler for quality, the first thing you look for in such a situation are subtitles. Hunting the web for subtitles is definitely a pain and after all the work, sometimes you end up downloading subtitle that is off synchronization. Now, VLC conveniently provides you with the option to download and sync subtitles in the application.

Steps to Download Subtitles.

- Go to View > Download Subtitle.
- Click on Search by name > Select the appropriate result.

Select your subtitles from the list of ones available

- Click on Download Selection

Steps to Synchronize Subtitles.

- Go to Tool > Track Synchronization.
- Change setting in the dialog box.
- Change the delay.

Play Media Contained In Archive Files

Compression is a necessary evil and at times, the only thing standing between you and a full hard drive. If, after all of this, you realise you cannot listen to your share of motivational songs in an hour of need, just because you compressed them and forgot about it, one is bound to get irritated. Do we need to go through this process every time? Not really. If you have media in your archive file you can directly play it on VLC, saving a lot of time and effort.

Steps to Follow

- Just open the zip/rar file on VLC.
- If the file is in parts just open the first file and all the subsequent files will automatically play, make sure all the parts are in the same folder.

Record a Part of the Playing Video

Going for a full fledged video editing software suite just to

share your favorite clips from longer videos sounds like overkill, doesn't it? VLC comes with a handy trimming feature that is as convenient as it is diverse in its power. The recordings are saved as mp4 files. This means that you can play videos from any format from VLC's diverse range of supported formats and actually get clips in the standard mp4 format. All this from what you thought was a mere 30MB media player.

Steps to Follow

- Before you record, check the target directory in Tools> Preferences>Inputs/Codecs>Files>Record directory or Filename
- Press the record button to start recording and press the stop button to finish. You will find your recordings in the folder set in the previous point, which by default should be the Videos or My Videos standard windows folder under Documents.

Have fun with VLC

Now when we are through all the serious VLC tips and tricks, here are some wacky tips that will help you have fun with the software.

Inception Trick

- Open VLC
- Press Ctrl+N
- Type screen:// (without quotes) in the opened window and hit play
