

the game. While wandering around, you'll see a Pokemon silhouettes button located at the lower right corner of the screen. Tap it and you'll find a full list of all the Pokemons in your vicinity that you can catch. The footprints below each Pokemon denotes the proximity; the fewer the steps, the closer the Pokemon. Further, tap the Pokemon that you wish to catch, and it will increase the chance of you finding it. Quite handy when you're out hunting, isn't it?

Use Ingress map to find Pokestops

Pokemon Go's location data is derived from Ingress, the company's earlier realworld exploration game. Major players of Ingress have uploaded the location data which is why Pokemon Go already knows the coolest places in your locality. Although the company has slightly retouched the map, it can be still used to find Pokestops. Download Ingress from your app store and create an account. After this, go to <http://ingress.com/intel> and you'll see the map. The white spots that you'll see are XM energy hotspots in Ingress game. The more XM spots in a particular area, higher the chances of finding a Pokemon there.

Efficiently use Incense to catch more Pokemons

Incense is an item in the game that allows you to catch Pokemons while sitting at home, work, or other place. However, sitting at one place and waiting for the Pokemons to come to you isn't efficient. It has been pointed out that if you sit at one place you'll be spawned with one Pokemon every five minutes, when if the

player is moving at 7.5 miles per hour he is likely to get one Pokemon every minute. That means you'll have to move 200 meters between spawns. With this method you can easily capture as much as 15 Pokemons.

Deal with common problems

One of the most common problem is not being able to connect to the server. This is very common and most of the time happens because of the overloaded servers. If you face this, just check the server status page <http://cmmcd.com/PokemonGo/> and try again after sometime. If the game says "GPS signal not found", make sure the location services are turned on.

If they're already on then wait for sometime. As this error is displayed before the game is connected to the server. However, if it still persists toggle your location services.

If the game doesn't open on your phone, try restarting your device. If it still doesn't work, update the game. Else, delete the game and reinstall it.

If Lure modules and Incenses do not work then try to switch your phone's time to the network time that the carrier assigns.

If the phone freezes while you are catching Pokemons or during the battle, try restarting the game. Hopefully, the Pokemon that you were about to capture will still be there.

Install Pokemon Go on PC with Nox

Nox Emulator is a far better alternative to Bluestacks App Player. It's fast, simple and comes with Pokemon Go preinstalled. Download and install Nox App Player from

Periodically open the panel and keep checking the footsteps

en.bignox.com/en/download/fullPackage

Launch the Nox player after the installation is complete and head over to Settings. We'll need to tweak some settings to make our system ready to play Pokemon Go easily. Under Settings, go to General > turn on "ROOT". Then, go to Advanced > set "Performance settings" to "HIGH" > Save Changes. Add your Google Account (Settings > Accounts > Add Account). Go to Play Store and download these apps "Lockito" and "Google Maps".

Download and install Xpose installer from http://dl.xda.xposed.info/modules/de.robv.android.xposed.installer_v33_36570c.apk

Open Xpose Installer > Framework > Install/Update. After the installation is done it will ask you reboot. DO NOT REBOOT. After this is done, click on "Soft reboot". Open Xpose Installer > Downloads > search for "Mock Mock Locations" > install it. Again open Xpose Installer > Modules > make sure Mock Mock Location is checked > reboot Android.

After the system started, go to Xpose Installer > Modules > Mock Mock Location > disable "All apps" > Add app > look for Pokemon Go. Now go to the phone Settings > About > tap Build number for several

times and you'll be a developer. Under phone settings go to Developer options > check "Allow mock locations".

Spoof Location

Spoofing Location is easy. Click on "Virtual Location" button located at the right side of the emulator > enter your local coordinates > click "Geocode" > hover over the white box at the bottom > click OK. You're done. Launch and play Pokemon Go from your PC.

Place Lure modules at high density areas

With Lure modules users can stay at one place instead of roaming around and finding Pokemons. Although similar to Incense, it has subtle differences. Firstly, you cannot place a Lure module just anywhere. You have to be at a Pokestop. Secondly, Lure modules are more powerful than Incense. Lastly, as Lure module emanates from a Pokestop, any player can share the effect. Placing a Lure module at a highdensity Pokestop will attract lot of Pokemons.. A single Lure Module is available for 100 PokeCoins, however, you don't have to buy it. Once you reach a particular level you'll be automatically rewarded one. Just remember to use it wisely.
