

Dark Matter still elusive

Darkmatter still elusive to scientists after extensive experiments at Large Underground Xenon(LUX) experiment. dgit.in/LUXdarkmatter

Q&A

You do get a heat sink with the Core i5 - 6400, so no, you don't need to buy a separate heat sink. While the cabinet does have cooling fans, you need to assemble your computer and monitor temperatures to figure out if you need to add more cooling fans. If your CPU temperatures lie around 45-60 degrees celsius and if your GPU temperatures are around 40 degrees celsius while idle, then you don't need more fans. Then you need to load your CPU and graphics card to see if the temperature rise is gradual and not a rapid spike. In that case, you'll need a fan or two extra. Check out this video to know about maintaining cabinet pressure with different fan configurations (<http://dgit.in/2a3ANxJ>). As for the assembly guide that you've mentioned, it's a bit dated, so here's one with newer components and better detail that's also easy to follow (<http://dgit.in/HowPC>).

As for certain processors not having heatsinks. It was observed that enthusiasts who opt for such high-end processors generally buy an aftermarket cooler anyways, so Intel decided to stop offering coolers with the retail packaging for these high-end processors.

While you didn't mention how much money you have to spare, I'd suggest getting an upgrade for the graphics card to a GTX 1060 or AMD RX 480 and a better power supply. Maybe you can scrounge together enough for a Seasonic S12D or Corsair RMi series.

To read or not to read

Hi Digit! I've got a Dell Inspiron N5110 laptop whose DVD drive sometimes doesn't detect the dvd. But when I eject and re-insert the DVD about 2-3 times, it starts reading the disc. Sometime I have to move the lens part of DVD drive up and down then it detects the dvd. What can be the problem?

—Abhimanyu Singh

A laptop ODD

A multitude of possibilities are there. And they all point towards a messed up DVD drive. The belt drive moving the lens head might not be snapping all the way to the edge. This means that it won't be able to read the zero-sector of the DVD disc. Or the protective lens over the laser diode might be a little foggy or dirty. Also the alignment could be out of whack. We recommend that you call up the Dell service helpline and schedule an RMA to swap your ODD.

Mac or Mac

Hey, I am confused between two laptops namely the Macbook Pro (MD101HN/A mid-2012 model) and the Macbook Air (MJVE2HN/A 2015 latest model). I am a

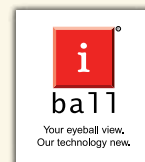

Apple MacBook

Computer Science Undergraduate student and have to do basic programming in C, C++, Java, etc., and all. I do not need space at all because the Macbook Air has a 128 GB SSD and I will hardly have need for 20 GB space after counting all my music and photos. I want to know if 128 GB is sufficient for me. Because I don't play games at all and will not have large applications. Aside from programming and listening to music I don't think I'll make much use of the laptop. I need your opinion for the above two laptops. Which one should I buy?

—Harsh Wardhan Chaudhary

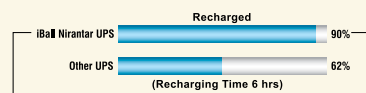

Whether you are using GNU C compiler or listening to music, a Macbook Air is a really expensive piece of hardware to do either task. So let's take performance out of the equation since both devices can easily manage the tasks you've mentioned. You can always get a USB drive and extend your storage so get the newer Mac as the SSD makes a world of a difference. 

RICHARD MAY NOT **BE READY** BUT
iBALL **NIRANTAR UPS** RECHARGES
33% FASTER THAN ANY
STANDARD UPS

Express Recharge.
High Performance.

i Nirantar UPS
bali NO LOSS. BOSS!

Only iBall Nirantar UPS gives you that extra backup facility
(Faster recharging makes it ready for extra backup in less time)
