Battery level indicator (Physical or otherwise)	1	1	1	0	1	15

HOW WE TESTED

Audio tests can never begin without playing one of the most-listened tracks, so we began with Pink Floyd's Hey You. The fretless bass by Roger Waters is an excellent test of an audio equipment's bass response, and this is what we threw at our speakers first. We followed it up with instrumentally extravagant tracks such as Michael Buble's Feeling Good and John Mayer's I don't need no doctor.

We also played Baba O'Riley by The Who, Rise by Flobots, and the usual test tracks that we use. We then tested each of the speakers' Bluetooth reception range - once in open space without any interfering obstacles in between, and then inside a home setup for real world wireless connectivity range. Audio performance also involved using the frequency sweep file of the entire sonic range, to test how well the speaker balances the audio across all frequency

ranges. For battery life, we played each of the speakers continuously, with an approx. 5 per-cent scope for more battery stamina.

Our final round included listening to the same track on each speaker in multiple environments, such as room with open balcony, large room, enclosed living room and outdoor. This was to see how clear and powerful the speaker performs in multiple situations and how well they adapted to different environments.
