

#Skijump

Love VR games? Here's another interesting one that also takes care of your fitness. <http://dgit.in/skijumpGP>

Nokia's VR camera – Ozo

Nokia's professional level VR camera – Ozo is available at a discount of \$15,000 on its original price of \$60,000. <http://dgit.in/NkiaOzo>

Smart SoHo

fairly detailed understanding of the equations that govern jet propulsion efficiency — if you want to, no pressure.

And we haven't even started about Twitter, Reddit, 9GAG, BuzzFeed, YouTube, Facebook, Quora, Tumblr, and all the other minor and major black holes of time that exist on the world wide web. In the end, you've usually done everything except work. Sound familiar? What you need is StayFocusd, an extension that helps save time and increase productivity by limiting access to distracting websites. You can create your own blacklist of blocked websites or use the Nuclear option to block the whole internet for any amount of time that you specify. That's right, be bold and block your own internet, because why not? It's the biggest productivity hack of 2016.

04 RescueTime Track your productivity

<http://dgit.in/RescueTimeExt>

If blocking the internet seems a bit too extreme, you can always get a personal time tracking app to shame you into being more productive. We've all had those days at one point or another, you

drift through the day, you think you're being productive, and at the end, you're left wondering, "Hey, what did I do all day?" Seeing how most of us spend a significant part of our working lives on the internet, wouldn't it be nice if you could find out where exactly you were spent your time and how productive you have been? RescueTime does just that. At a glance, it shows you how much time you've spent online, where you've spent it, and

even assigns a productivity score for the day. It's really satisfying to see those scores go up once you know how it works and start taking proactive measures to beat your daily average.

05 Rapportive Build rapport faster

<http://dgit.in/RapportiveExt>

We all use email, probably even more than we use phones now. However, every time you start interacting with someone new over email, you're left scouring the internet about where they work and checking up their social profiles to get a better sense of who they are — and more often than not reach inactive profiles and dead ends. But why go to the internet

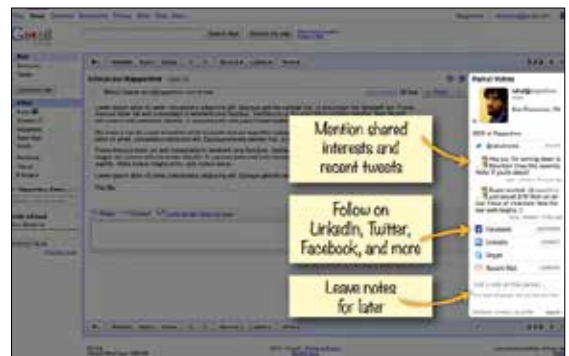

when you can have the internet come to you? Rapportive adds a panel right within your Gmail inbox that provides you with a quick overview of the person you're interacting with. It's one of those things you'll wonder how you got by without once you have it. You'll get their picture,

location, job profile, company, and other helpful information you might need to build a quick rapport.

06 Wisestamp Smarter email signatures

<http://dgit.in/2bmeGHL>

With extensions like Crystal and Rapportive, you'll know exactly who you're dealing with and how to best engage them — now how about extending the same courtesy to them? Wisestamp allows you to create beautifully designed, smart signatures in less than a minute. Of course, you can create your own signature by editing the settings in Gmail as well, but the

default editor is too simplistic to create anything more than the usual warm-regards-last-name signature. Wisestamp on the other hand, gives you a WYSIWYG editor and tons of control options to create a signature that will not only inform but impress your recipient. Apart from the usual elements of a signature (such as name, picture, and designation...), you can also add live web elements such as your last tweet, latest Facebook status update, link to your latest blog post, links to social
