'Allo' stickers

Google Allo's stickers are the quirkiest stickers you would have ever seen! <http://dgit.in/qrkyAllo>

profiles, notices and disclaimers, and much more. The signature is inserted dynamically into your email editor each time you compose a new email.

07 Zapier Automate everything

<http://dgit.in/ZapierExt>

Isn't it always the little tasks that add up to create that seemingly unsur-

mountable block of endless work we all deal with? For instance, let's say you get an email about a project update, but you're managing the project on an external task management app like Trello – what will you do? Open Trello in another tab and go add a card to your board, right? Well, why don't you just Zap it instead? Zapier allows you to integrate hundreds of apps, define custom rules, and automate all the annoying little tasks, so you can spend your time working on the bigger picture. Asana, Gmail, Calendar, Drive, Contacts, Evernote, Trello, Dropbox, and Salesforce are just some of the apps that Zapier allows you to connect. The Zapier extension notifies you whenever Zapier runs a task, gives you recommendations on new Zaps, and lets you pause and edit live campaigns. Zapier is aimed at business users so you will find most popular task management, work communication, and CRM apps to connect with each other.

08 Hiver Supercharge your Gmail

<http://dgit.in/HiverExt>

We can all agree that Gmail is a great service – it's fast, functional, and relatively free of faults, but sometimes you can't help get a feeling that it's too

stripped down. If only you could do a more with it; like, maybe snooze emails to read later, that isn't too much to ask, surely? Well, using the Hiver extension, you can turn your Gmail inbox into the productivity and collaboration powerhouse you always wanted. You can snooze emails, set reminders, write notes on emails, create and share email templates, and schedule emails to send them later. There are a few features that facilitate better teamwork as well such task assignment and shared labels which allow you to do things like manage customer support, organize sales leads and contacts, and delegate and track emails as tasks. All this happens right within your inbox. The extension comes with a 14-day trial

version which you can upgrade to a paid plan if you find the service to be useful, which you probably will.

09 SessionBox Multiple active sessions on one site

<http://dgit.in/SessionBox>

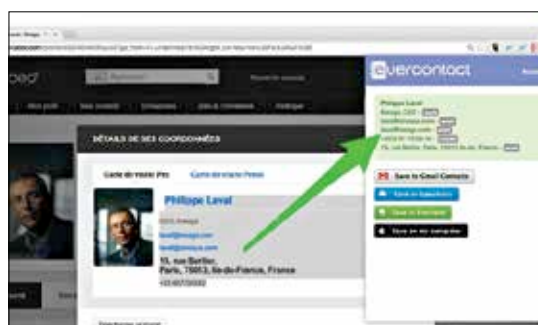

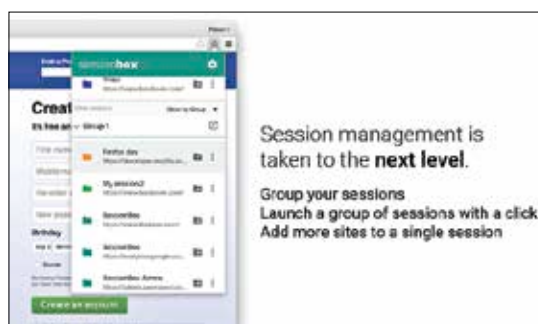

Are you tired of using different browser windows to stay logged in on multiple accounts at the same website? We've all faced this problem: You're logged into your work email and you need to check your personal email, normally, you would have to either switch accounts or log yourself in on a new browser window or a different browser, and this becomes tedious really fast when you take into account all the other websites that you have multiple accounts on. SessionBox puts an end to this problem. It adds a panel within Chrome where you can create and manage multiple active sessions on a website. Say goodbye to all the account switching, secondary browsers, incognito tabs, multiple windows, and let SessionBox handle

everything for you in one place. The extension also syncs your sessions across devices so when you log in to Chrome from another device – you've got all your accounts at your fingertips.

10 Evercontact Superior contact management

<http://dgit.in/EvercontactExt>

Apple and Google both offer some basic contact management tools but they usually work in the background and you have little active control over them – you literally have to go over there if you wish to make a change or manage said contacts. Evercontact takes the idea of contact management and really elevates it to the next level. It has two modes: Passive and active. In the passive mode, Evercontact automatically scrapes emails in the background and syncs any new information found on existing contacts so that your contact list does not have obsolete data. Using

the active mode, you can highlight text within an email, click on the 'e' button to analyse the data, and save the new contact either to your Gmail, download it as a vCard, or even save them directly to Salesforce as leads or contacts. Don't lose an important contact again. **4**
