repel the alpha-particles, and all of them will penetrate it.

Now, the result followed the assumptions up to some level. Most of the particles could penetrate. But the result was astonishing due to one fact, which was that many (although only a small fraction) particles got deflected with large angles, some even rebounded close to 180 degrees. This meant that the atom had some point in it, with huge charge density, which was able to deflect the alpha particle. This led to the concept of a nucleus.

That's it. I know it's a long explanation. But I don't have the talent like you guys to shorten my explanations (I mean like you do in dmystify).

I am interested in physics, and I would like to tell you that, I was expecting more from this dmystify. Quantum Physics is a really vast topic which cannot be encapsulated in 64 pages (I agree).

Yours,

—Shashwat Gupta

❏ Oh no. I was so sure I corrected that! I even put the image explaining it on the very next page! Looks like I messed up and sent the wrong file to print :-)

I will make sure to carry a corrigendum in the next dmystify. Thanks for pointing out the error.

And as you could guess from the book, this was a case of biting off way more than I could chew, because I honestly don't understand quantum mechanics even now.

Are you interested in writing such books? We could use the help if you're interested in being published... Let me know.

—Robert

✉ I am an old reader of Digit and I was a big fan of many editions of Skoar!, price comparison articles, and game related articles.

But for the past few months, I haven't been able to understand the meaning of the articles as the words are very different from normal vocabulary. Every article seems to be personalized by the touch of its respective author.

Since readers like me who are not into deep vocabulary do not use words of speech that the authors do, I often find it difficult to understand what the authors want to convey.

With due respect I want to suggest that kindly please make the articles straight to the point so that it is clear what the author wants to say.

Sometimes when I cannot understand an article in the magazine, I turn to other tech websites or just Google it.

I am sorry If I offended but I hope you will take my criticism in a healthy way and I look forward to seeing a simpler digit magazine.

—Sumit Jaiswal,

Research Scholar, IIT (BHU), Varanasi

❏ It's always difficult to maintain a balance between simple language, and the need to use language that explains things in a better way. Sometimes to go with the theme of a particular article, we'll adapt our writing style. For instance, if we're writing something about the past (retro) we might make references to things of that era or we might even change the language style for effect: *Doth thou comprehend, dear sir?* While writing an article about the millennial generation last month, we were forced to use slang that is popular in that crowd. Even I wasn't familiar with some of the lingo but I got to know a few things as a result. Point taken, though. We'll try to keep it simple.

—Siddharth

✉ HELLO DIGIT! It's me Anirudha. And I'm still 16. The earlier issue of Digit i.e the August issue was filled of amazing articles! The one which made me think a lot was "The quest for smartness" by Siddharth!

Nowadays, there's a smart device behind everything! But the thing we forget is that as we get our things done, the devices keep on tracking every little thing! Do we really need their help? We are living in a world where people are being tracked by smart devices! We give up our privacy for comfort! And it's really dangerous. I don't want anyone to track the places I travel to, the people

I communicate with, or the websites I visit! All data is being shared from one device to other and also to the corporations! Though some people are ready to barter their private data, there's a majority who aren't!

Moving on, there are positive as well as negative aspects in the devices being smarter! But the main question is in this smart connected era, are we losing our autonomy? (That's the thing I've been thinking all the week). As the devices get smarter, the more we're dependant on them, the more we lose our ability to think for ourselves! We don't deviate from our daily routine anymore, there's nothing new in our daily life! We wake up, eat, like pics on Instagram, take a bunch of selfies, play games, and sleep! All the work is done by devices in this era! Nowadays we have to ask Siri for the weather in order to decide whether or not to take an umbrella while going outside. This is a great example of how we are dependent on smart devices! We use the devices more than our brain... And that's the point. Devices have taken the place of processing every single task, which should be the brains work! Now it's up to us, whether or not to let the devices take the place of our minds! Will we lose our smartness while making the devices smarter? It's something to think about. Btw I'm bad in writing letters so please be careful if there are mistakes! Thanks for reading!

—Anirudha Gorad

❏ Hey Anirudha, Thanks for writing in.

Good work reading between the lines :-)

I think you've understood my underlying sentiment perfectly well.

What you are saying: "Will we lose our smartness while making the devices smarter?" was precisely what I was hinting at.

Do keep writing in with your suggestions as well. Glad you liked the editorial.

—Siddharth
