

Infinity v1

The flash gun was truly a small revolution in the gaming industry for its time and a similar event is about to happen. The VR hype is real and we have tons of VR games in the market. While we wait for VR headsets to get cheaper, we are already seeing a lot of additional accessories to elevate your virtual reality experience. The Infinity v1 is essentially a VR gun with haptic feedback that can be used in VR games. Initially intended for military purposes, it would be an awesome add-on

to gaming. It's still a prototype and only supports single, burst and auto-firing modes. With feedback and community support, we're sure that several weapon functions can be emulated on the VR gun. They are yet to extend compatibility for the major VR platforms since the demo was done using the PhaseSpace and Sixense STEM tracking systems. DOOM is already being showcased with VR support while Serious Sam just announced a VR game recently. Imagine the madness when this virtual gun is combined with such insane first-person shooter games.

Everyday Backpack

We have come across many projects but this one takes the cake for being the laziest named project ever. "Hey, we are creating a backpack that people can use everyday. What should we name it?" "Everyday Backpack?". "OK!". Available in three options – Backpack, Totes and Sling, everything from the design to the innovation, we haven't seen such an advanced bag before. With an endless number of intelligent pouches, pockets and sleeves, the possibilities of organising your gear is infinite. Not just the regular laptops and tablets, but the sleeves are designed to support professional photography gear as well. Easily one of the most innovative products to be featured in this section, the Sling is available for \$125, the Totes at \$155 while Backpack comes in two capacities of 20L and 30L, selling at \$199 and \$229 respectively.
