

Nikon D3400

A new entry-level DSLR in the market results in several things. You'll spot more people doing acrobatics holding a camera near tourist spots. You'll also notice every Tom, Dick and Harry create a photography page to their name and overlay every single photo with their watermark in comic sans. Nikon released the flag bearer of their popular D3xxx series, updating the aging D3300 with the D3400. One of the most important highlights of the new camera has to be the addition of Nikon SnapBridge camera-to-smartphone connectivity. This makes it easier for all you guys to push those epic shots from your camera to your phone and onwards to all your favourite social networks to garner likes and love from strangers. The D3400 houses a 24.2-megapixel APS-C CMOS sensor powered by the EXPEED 4 image processor. Nikon is giving you a new Nikkor DX 18-55mm f/3.5-5.6G VR kit lens and by paying extra, you can also pick up the Nikkor DX 70-300mm f/4.5-6.3G ED lens. It's not really recommended, but if you happen to be a budding YouTuber as well, the camera is capable of shooting 1080p videos at 60/50/30/25/24p. So there you have it. From starting off as an amateur photographer to a newbie in shooting and editing videos for YouTube, the D3400 has you covered.

Sport Pulse

It's not a surprise to spot someone wearing a fitness band on their wrists while they patiently wait for you to notice it and proceed to start bragging about the number of miles they have covered. Jabra has released a new wireless headphone that can track your heart rate and other bodily functions. It's not the first time that we are seeing this concept but the company has said that it's the first time for a wearable device to be part of a prescription wellness program. This program is directed towards combatting cancer, diabetes and obesity. What this means is that along with the doctor writing you a never ending list of meds, they will also be able to prescribe the Sport Pulse headphones to their patients under the TrainerMD's HIPPA-compliant 360 Health Program.

What a time to be alive right? The headphones will be able to collect VO2 Max levels and your in-ear heart rate. The collected data will be straight away sent to doctors, trainers and nurses where they'll be able to monitor it on the TrainerMD dashboard with real-time notifications on pulse, calories burned and other data. It might turn out to be quite a successful program, making it easier for the doctors to diagnose problems rather than solely relying on the patient's word. There are different versions available under the Sport Pulse line, and if you're a Jabra fan, you probably should take a look at them.

Project Alloy

VR is slowly becoming mainstream and we can see it steadily traversing towards video games. Intel was beginning to feel a little left out so they displayed their own take of a standalone VR headset that doesn't need to be connected to a phone or PC. Big fat cables are a huge shortcoming in the current headsets but Intel's solution is wireless. It includes a processor and a battery inside, and a camera which lets you see your surroundings. It's not technically a VR headset but more of a combination between virtual reality and augmented reality. There are sensors all across the device and it's able to track the room around you. We've only seen a brief demo so far and are yet to receive any more details about how this concept should be working like in the first place.
