Ducati XDiavel

You probably might not be aware of the Sturgis Motorcycle Rally organised in the US, unless you're a bike connoisseur of some sort. Probably the biggest rally in the country, Ducati's debut at the rally had to be special and what better way to celebrate it than with a customised version of their XDiavel lineup. Ducati collaborated with Californian customiser Roland Sands to give us the concept XDiavel while retaining the cruiser aesthetics of the popular series. It also makes sure it doesn't stray away from the fundamental

Ducati design, hence bikers who are familiar with their bikes will be able to recognise it straight away. The concept bike didn't go across any radical change in design to the exteriors or the components, still pumping blood from the heart of a regular XDiavel bike. There isn't any additional functionality introduced into the bike, and it distinctly mirrors Roland's work. Ducati went a step ahead with the custom designed XDiavel and built an exclusive line of accessories and components following the same design aesthetics of the bike. The entire project was a three-month long build and as mentioned earlier, both Roland and Ducati decided to keep the internal components the same while overhauling the exterior design. There's only one custom designed XDiavel from Roland currently, and we don't think there are going to be anymore.

Rimac Concept_One

The Tesla S model has destroyed several opponents over the months, humiliating others in its Ludicrous mode. And now the inevitable has finally happened and Rimac's Concept_One has obliterated Tesla's record. The underscore in the name of the car might feel uncommon, but since it's not the final name, we'll let that pass. Touted as the world's first electric supercar, the car can go from 0-100kmph in just 2.6 seconds, capable of reaching top speeds of about 354 kmph. Why is this insane? Because it's an electric car. How do they do it? Well, according to their website, electric cars display huge potential when it comes to acceleration but lose out on performance when it reaches high speeds. Rimac

believes that they have solved this problem with "secret weapons". Basically, what they mean is that the four motors output enough power and torque to brace the high speeds, where each of the motors are connected to independent gearboxes, while maximising performance further with seven independent cooling systems and subsystems. To have a

better look at how the Concept_One embarrasses the Tesla S P90D (in Ludicrous mode), watch the following video: <http://dgit.in/RimacC1>. For a more competitive angle, the creators of the video introduced the hybrid LaFerrari against the car, and this might sound like one of those clickbait stories, but the video will actually blow your mind.
