

Audio call from Duo

Google's Barebone video calling app – Google Duo might soon add an audio calling option as well <http://dgit.in/DuoAudio>

Zeta 'ultimate' security update

Zeta allows you to nominate 'trusted contacts' to rescue your mobile wallet helping you to gain back access to your app

Feature

GIFs, the app also offers viewing a GIF frame by frame, changing the frame rate and converting the GIF to video when you need to share it through a service which doesn't support animated GIF. Though all these features (apart from viewing) are locked behind an in-app purchase. If GIFs are really your thing, there's no denying that this app is a treat.

Gboard

Price: Free

What do you get when you combine one of the most used web services in the world with one of the most used app? To put it simply it's a keyboard

letter, which are already there for the stock Google keyboard are missing in Gboard. And the inbuilt search engine is missing from the Google keyboard on the Android side, as of the writing of this article. Maybe in future updates, Google unifies both these keyboards and provides it to both the operating systems.

Dripler

Price: Free

This app aims to help you make the most out of your smartphone. How? First, the app recognises your device, the manufacturer, operating system and carrier service provider. Then it uses this information to curate a news feed specially for your device. It picks out articles from many mobile and tech blogs and lays it out for you to enjoy. The articles are

by Google with an inbuilt Google search. You can actually browse your search results without ever closing the keyboard. Now you don't have to close your messenger to show off your general knowledge skills. You have all the answers of this universe. Google search is not the only feature the app has to offer. Standard features such as predictions, swipe typing, emoji palette and a GIF search engine are also inbuilt. But features such as deleting text in bulk with the delete key, one-handed use and quick input of a number, symbol or an uppercase

ads, trackers, specific media, social network widgets and tonnes of other stuff. 1Blocker is a titan in this space. Apart from letting you block specific categories of content, it also enables you to go down to specific details by letting you pick intricate blocking rules within the provided categories. The app doesn't stop there, it allows users to create their own rules on their web editor and send it to your phone, essentially opening the app to all sorts of content blocking. The free version of the app allows only blocking of one category, but with a small payment,

sent to you as and when they are released by the original publisher. There's also a filter that can block all game-related articles from your feed, for hardcore non-gamers (if that's a thing). The app has access to a large number of blogs, and you will find interesting new apps and hidden features of your phone. Of course, the articles are targeted at anyone who owns the same model of phone, so personalised interests may vary. It's still a good way to discover interesting stuff though.
