Unruly laptops and PCs, finding and installing custom ROMs, reviving HDDs and more...

From smartphone issues to problematic laptops, technology sometimes refuses to co-operate. But fear not, for all you need is a toolbox.

Custom Canvas ROM

I want a custom Lollipop ROM for my Micromax Canvas Juice A77. Team Digit, can you help me in this please?

—Aditya

A Hey Aditya, we tried searching for dedicated development threads for the Canvas Juice A77 but unfortunately, the device isn't popular enough. You can find a dedicated thread in the following link: <http://dgit.in/MMXCJA77> but we're afraid that there aren't any custom Lollipop ROMs available. Why not build your own custom ROM for the device. You'll find loads of tutorials on XDA forums. Even if you're aren't successful in building a stable ROM, you'll be able to learn a lot.

Moto fever

Greetings! To the team of my all time favorite tech/science/gaming mag. So, here's what my problem is. I purchased a Moto X Play last year and I am facing heating issues on the handset with the temperature going as far as 48 degrees. I chose to let it slide as it's a common issue among high end devices. But I couldn't keep a blind eye when I discovered that after recording a video for more than 10 minutes, the camera screen started lagging horribly. And I'm not sure if it's due to heating or some hardware malfunction. Is it serious? I am all freaked out because this handset is like my child (go on, laugh, I dare you!) and I would like the advice of the Digit team on this matter.

—Abhishek

A Greetings Abhishek. You're right on the part about devices usually heating

Moto X Play

up during intensive tasks such as playing games and shooting videos. Most of the time, the heating issues are software optimisation bugs and rarely a hardware problem. It would be best to wait for an official software update from Motorola. Users have also reported the problem to be resolved by factory resetting the device every week. Sometimes, an app causes heating issues because of poor memory utilisation so, uninstalling the most recent apps might work out.

A disobedient laptop

My laptop very often shows this message that Intel Display Driver (8R) just stopped working and has just recovered. It freezes for a few seconds and sometimes it results in BSOD. How do I solve this? Hope you can help me resolve this. Thanking you in advance :)

- **Laptop Details:** ASUS ROG G1JW
- **OS:** Windows 10 64-bit
- **Processor:** Intel core i7-4720HQ

- **RAM:** 8GB
- **GPU:** Intel HD Graphics 4600

—Jaison

A Hey Jaison, this is a quite commonly reported issue by a lot of users on the Internet on Windows 10. The fix for this issue is to simply have the latest Intel HD graphics drivers installed from the official website. If it still persists, there must be issues with the game you're trying to run. Also, another thing to note is having the latest updates of the game installed. Usually, day-one bugs are resolved after the game publisher releases official updates.

Startup issues

Q. Hi Team Digit, I'm using a desktop pc with Core i3 processor and 2GB RAM running Windows 7 Ultimate Edition. The problem that I'm facing is that the desktop is not starting. I tried disconnecting and reconnecting all the outer connections but to no avail. I also opened the cabinet and cleaned up the fans and all. Disconnected all the cables from the motherboard and reconnected them, removed the RAM and cleaned it a bit though it seemed clean and connected it again. While still keeping the cabinet open I powered it on again with all connections properly done, what I saw was that there would be only a momentary movement in the system fans and it would stop almost instantly. Also the LED light indicating the power connection would be on, when I power-on the UPS but as soon as I'd press the CPU power button that indicator light would die down too. Seems like as soon as I press the CPU power button, it
