Q&A

stops receiving power. Kindly suggest me a solution.

—Jagrit

A Hello Jagrit, the problem you mentioned might have four possibilities. The first could be that your PSU is damaged and isn't able to provide power to the system. Try connecting a different PSU to your system. The second could be that your PSU is not able to provide enough power to all the components in the system. To determine this, you'll have to check your PSU wattage and calculate the total wattage required by all the components in your system. If it adds up more than what your PSU offers, you'll need to upgrade it to a higher wattage. The third problem could be with the RAM which you can determine by installing a different RAM stick. The fourth problem could be with your motherboard which might be short-circuiting somewhere on the PCB. Here, the only solution would be to test your components on another system. Once you go through all the processes mentioned above, you might be able to pinpoint the source of the problem.

Cyanogenmod on Moto E

Hey, for the past two days I am trying to install Cyanogenmod 13 on my Moto E. But after installation it never goes past the first boot, (flashing logo). I followed these steps:

1. I rooted the phone and verified it using root checker and there in no problem with the root
2. I installed the custom recovery (teamwin - twrp). It also works fine.
3. After installing Cyanogenmod once and getting stuck due to the above mentioned problem I repeated the process but this time after factory reset I manually formatted the system and data but the problem persisted. I even let it be in its first booting stage for more than 2 hours but to no use.

I used two versions of the latest stable release in zip format from the official website. How can I solve this problem?

—Rawat

A Hey Rawat, although you might have followed the above steps, there must have been some sort of confusion in the order. The steps are given in a chronological order and failing to follow them will end up in bootloops. Here's a guide on how to setup Cyanogenmod 13 on the Moto E: <http://dgit.in/MotoECM13>

USB Controller for HDD

Unresponsive HDD

Hi Digit Team, I have a 4 year old Seagate Goflex Freeagent 1TB hard drive which stopped working recently. I even scanned it with a licensed anti-virus for bootloader virus but nothing showed up. I tried uninstalling the drivers and reinstalling USB drivers as well but even that didn't work. The drive shows in devices and printers but not in the Windows explorer and neither does it show up in the list of devices in my BIOS. I have very important photos in it. Could you please suggest what might be the issue? Please provide contact details as well in case you know someone who can fix this.

—Ankit

A Hi Ankit, we believe that the controller on your external hard drive has failed. This usually happens on these portable/external hard drives. You can either put it up for repair and have the controller replaced to solve this problem. But if you are looking for an easier way out, you could simply open up the device and connect the hard drive to your PC through the SATA port. This will of course need some experience. So if you aren't sure about doing this, get someone to help you out as wrongly handling the drive might damage it beyond recovery. **E**

Element of Success

Add a little attitude to all your presentations with iBall's 2.4GHz Wireless Presenter. Probably the most powerful presentation tool an executive will ever hold !

- 2.4GHz Wireless Trackball presenter device
- 6 Button with built-in laser pointer
- USB Micro receiver
- Use as mouse with Trackball & Left click button
- Left & Right button for previous or next slide
- On/Off switch to save battery life
