

Ransomware is always built to look like it's the real deal!

'Set up' group, click on Set up show. Under 'Show type', select 'Browsed at a kiosk'. Under 'Advance Slides' select 'Manually'. This ensures that they keyboard and mouse interactions won't make the slide change. To actually make it go away, just hit the 'Esc' button. Name the powerpoint as something friendly or harmless and watch the fun.

WEBCAM AND MIC

Recently there has been an increased awareness about webcam and microphone hacking, partly due to a photo of Mark Zuckerberg doing the rounds which shows his laptop having duct tape over the camera and the microphone. Even then, most people do not know how easy it is for someone around them to hack into their webcam and microphone feed. In fact, there is software available online that does it for you, if you do have physical access

to the target machine or can get them install it by social engineering.

Webcam hacking is highly illegal. It directly invades someone's privacy and we want to make it clear that you should NOT do this, especially on a computer people take home with them. Even if you see nothing, invasion of privacy laws might land you in jail, and if it can be proven that you spied on them in their private moments, you're done for. If it's a work computer in a relaxed office environment, and you know the person well enough to know they won't rat on you to the management, you might be safe, but you still might not, so do this at your own risk! We are not going to point you to one of the many webcam hacking software and websites because of this. The fact that this exists is all we wanted to tell you so that you can also protect yourself against such software in the future.

It's as easy as go phish

ALTER APP CODES

This particular hack will need some serious coding skills. To give you an example of what's possible, we point to the recent fake *Pokemon Go* app that was discovered. It seemed identical to the original app, but asked for way more permissions. The open source nature of the Android ecosystem means that doing such things is possible. You will need to get an APK of an app you want to do this with to begin.

- First download the dex2jar tool from following link <http://code.google.com/p/dex2jar/downloads/list>
- Extract the file and create the dex2jar folder
- Now you pick your APK file and change its extension to ZIP. Once that is done you can extract it and find the `classes.dex` file
- Copy the `classes.dex` file into the dex2jar folder
- Open a cmd window and type the path to the dex2jar folder
- Now type 'dex2jar.bat classes.dex' and press [Enter]
- Now Open the dex2jar folder you found `classes_dex2jar.jar` file
- Next you download the java decompiler tool from the following link <http://java.decompiler.free.fr/?q=jdgui>
- Last Step Open the file `classes_dex2jar.jar` in java decompiler tool now you can see the apk code

You can now alter this code and recompile it back into an APK that asks for additional permissions. If this method doesn't work for you, you can try a few online decompilers available. Keep in mind that neither method is guaranteed to work due to the huge variety of code and development methods used.

If you do successfully manage to create an altered APK, getting someone to install it should be easy. Just mention that it's an advanced beta file that has some additional features, and is being circulated for testing.

LESSONS LEARNT

You're probably going to be busy for the next few months trying your hand at these hacks, but remember that you can get into trouble by doing this maliciously, so please don't blame us if you go to jail!
