

ENCRYPTION FOR ALL

Moxie Marlinspike, the man who co-designed Signal

– the encrypted messaging app whose protocols have been adopted by WhatsApp and is soon to be seen in Allo's incognito mode – has his story to tell, about how he's brought encryption to all of us.

YOUR ONLINE IDENTITY

How much do these websites that you interact with know about

you? Apparently, a lot. A lot more than you think. But more importantly, what you should be wondering right now is where is all of this data saved, how secure it is and how could it be used.

3D FLOATING WIKIPEDIA

Wikiverse is an abstract reinvention of Wikipedia's

resources making the website's billions of pages visually more attractive. The interactive galactic map makes you feel like you would be sitting in a spaceship, gliding through the Wikipedia pages in space.

APPLE MAPS AND MORE

Apple might be experimenting in various sectors of technology,

but Craig Federighi along with Eddy Cue, Apple's senior software guys share how Apple is not an everything company and takes reward in other small things that they do well, and much more!

Intel, Apple continue race for AI startups acquisitions

The smaller houses of innovation are all being picked up by the giants in a bid to stay ahead of competition.

– By Souvik Das

A report stated that Intel is acquiring Nervana Systems, a startup that meddles with deep learning algorithm and artificially intelligent corporate data centres. Word on the street suggests that the behemoth chipmaker has paid nearly \$408 million as part of the acquisition deal, a staggering amount for a young startup, albeit highly specialised and equipped. The deal can be highly beneficial for both the parties. Intel has already invested its time and resources into deep neural networks and machine learning, and acquiring exciting startups remain key to advancement of technology beyond Intel's own portfolio.

Apple, meanwhile, has been on an acquisition spree for a while now. The Palo Alto-based company has previously acquired the likes of Perceptio, Vocal IQ (an AI startup similar in nature to its own Siri) and Emotient Inc., a startup

that uses deep neural networks to assess facial expressions and read emotions. Not to be left behind, the company went and splurged \$200 million on Turi - a firm that specialises in building AI solutions for multiple purposes. True to Apple's nature, the company has not disclosed anything regarding how it intends to make use of Turi's services, or how this alters the shape of Apple's rising inventory of AI technology and equipment. CEO Tim Cook had stated that the company is increasingly shifting its focus to AI solutions for all its innovation, and it is safe to presume that Turi falls somewhere within Apple's new game plan.

All of this is far from being new or surprising. The race for acquiring exciting Silicon Valley startups has been ongoing for a while now, as companies have ascertained that deep neural networks, machine learning and artificially intelligent solutions are indeed the way to go forward. Since 2011, between Intel, Google, Apple, IBM, AOL, Yahoo!, Microsoft and Salesforce, there has been 34 reported takeovers of startups working with artificial intelligence. Google has led the charts with nine acquisitions, the most notable of which remains DeepMind, creators of the world-record holder AlphaGo.

Intel, meanwhile, has made very specific acquisitions. Its acquisition of IndiSys was in the field of natural language processing, while the following startups were in the field of cognitive computing and computer vision & pattern recognition. The company has catered to

innovating the necessary hardware, and the network that should form the framework of tomorrow's quantum computing devices, all capable of machine learning on an advanced scale. This is further different from Microsoft's acquisitions, which has stuck to acquiring software startups that use deep learning to optimise the end-user experience.

All of this, though, gives out a very clear message. Artificial intelligence and futuristic computing is already upon us, and the labs of these tech behemoths are the most exciting zones of innovation right now.
