Canon EOS 1300D

A good camera for beginners

The Canon EOS 1300D is (obviously) Canon's latest upgrade to the EOS 1200D, Canon's lineup of entry-segment DSLR cameras.

The EOS 1300D uses the same, 18-megapixel APS-C CMOS sensor as the EOS 1200D, while packing an upgraded DIGIC 4+ image processor. Native ISO goes up to 6400, and is expandable up to ISO 12800. The camera houses 9 AF points, with one cross AF point to speed up focussing. All of this translates into uncomplicated shooting experience, although not the best in class. As with most budget DSLR cameras, the optical viewfinder is pentamirror and pentaprism, leading to a slight leakage of light internally. Thankfully, this does not disrupt your photos even when you shoot in extremely bright conditions. The EOS 1300D maintains a good balance of colours, and colour accuracy is fairly true-to-source. Pixel noise, however, is certainly very noticeable from ISO 800 onwards. The light processing is also not the best in class, and you will often end up increasing ISO values. It works fine when you are outdoors – mostly, landscape or street, and the ease and simplicity of shooting adds to the experience.

Shooting in low light, dusk or any situation with low colour temperature becomes tricky because of having to raise ISO. As a result, images tend to become grainy, sometimes even in relatively well-lit conditions. The pleasant vibrancy of colours is commendable, and shooting in vibrant, well-lit marketplaces in the evening or night sees the Canon EOS 1300D do very well, particularly because of the colours. The noise levels, though, pose an obstacle to the good colours that the EOS 1300D's sensor renders. The dynamic range of the EOS 1300D is not class-leading either, which leads to morphing of shadows, lower accuracy of colours in comparison to the likes of EOS 750D, and at times, noticeable banding in ISO 100, which becomes particularly evident when you shoot an object in shade under bright, direct sunlight. In terms of overall balance, though, the Canon EOS 1300D is certainly one of the best-performing cameras for its price, albeit a bit sluggish when it comes to rapid or continuous shooting.

The EOS 1300D is also one of the best cameras to get accustomed to the nuances of

manual shooting, and getting the hang of an interchangeable lens camera. Autofocus is faster and more accurate than any of Canon's previous entry-segment DSLRs, even in manual mode. Its neat and simple UI coupled with the guide meter encourages you to experiment with shutter speeds, ISO and white balance until you learn all the controls.

One of the most convenient factors of the Canon EOS 1300D is the presence of WiFi connectivity. To use it, you need to download Canon's CameraConnect app on your phone, enable Wi-Fi on the camera from the Wi-Fi Function option on the second-from-right Menu list, connect your phone with the SSID and password shown on the camera's LCD display. The Canon EOS 1300D allows you to sync the camera's Time and Location to your phone's, browse images on your camera's memory card and download to your phone, and use your phone as a viewfinder and remote shooting control. Remote shooting works fairly well with minimal lag, unless you have a distance of over eight feet from the camera.

The battery life could have been much better. With one full charge, I managed to shoot 229 photographs. I had kept LCD settings at default which translates to a very inconvenient LCD switch off time of 10 seconds and comparably dim brightness.

The Canon EOS 1300D, to sum up, is a very convenient camera to shoot with. It may not present prodigious photograph quality, autofocus speeds and/or additional features that really strike, but will appeal to many.
