ASUS ROG STRIX RX480 8G GAMING

Now with FanConnect

Price
 ₹28,000
 (+ Taxes)

ASUS' ROG STRIX series are quite well known for featuring a high over-clock, improved cooling and and software suite that's quite feature laden on its own. And the STRIX RX480 8G GAMING lives up to those standards. Coming to the card, the DirectCUIII cooling solution draws upon its predecessors and improves upon them with the Wing-Blade fans. However,

we've seen similar arrangements with all other manufacturers.

However, the FanConnect feature is new and a welcome feature. Instead of plugging all case fans onto the motherboard, you can plug them on the graphics card so that they kick in with the graphics card. There are a lot of games which will stress the GPU but not the CPU so the cabinet would have otherwise gotten a little hot.

On the performance front, the additional over-clock translates quite well in synthetic benchmarks but when it comes to gaming benchmarks, we only witnessed gains of around 2-3 FPS in Grand Theft Auto 5 and Rise of the Tomb Raider. However, with a price tag of Rs.28,000 with taxes on top, the card is a bit overpriced for the performance gains provided. The overclock coupled with FanConnect and the improved cooling solution do make the price tag seem less exorbitant but given that the entire competition is selling for much lesser, it might not end up being that appealing a deal.

GALAX GTX 1070 EXOC

Another flagship that provides the most value for enthusiasts

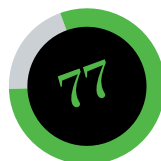

Price
 ₹39,000
 (+ Taxes)

Like the ZOTAC card, even this one pretty much gives you your money's worth. So you'd be dying to know which card between the two should you be on the lookout for. For starters, all GALAX cards seem to have been individually tested locally since they have a 'Tech-Lab' sticker on them. Then when you look at the build quality, it clearly has a metal front shroud and

two 100 mm fans. These fans don't share the hybrid design that we've seen on most graphics cards over the past two years but there's the protective backplate which is a plus point. There are also voltage-check points on the back of the PCB for those concerned with more complicated forms of overclocking. The video connectors are a little different, having two HDMI and two DP makes more sense with the whole VR ready atmosphere that we've got going at the moment.

Performance wise, we're looking at very similar FPS scores and even synthetic scores aren't that apart. What differentiates the two is that this card has a three year warranty period similar to most graphics cards but the ZOTAC card has a five year period. While those who purchase such high-end cards tend to upgrade as soon as the next generation comes in, they'd still prefer the five-year card over the three year card. And when you compare the prices, it's not that difficult a decision.
