616, which felt surprisingly stressed on this phone. Even though the phone performs well in synthetic benchmarks, the phone lacks the ideal performance which a budget smartphone should deliver. Quite simply, the phone keeps up with daily tasks like browsing, streaming videos or messaging, but not without occasional lags. The audio performance of the phone, however, is top notch for the price. The Dolby enabled audio output churns out good quality music.

The 13MP rear shooter does a decent job but is no match for the competition. Further, the smaller battery requires a charge after just 5 hours, which is outright poor.

WINNERS

Best Buy

Xiaomi Redmi 3s Prime

The smaller cousin to the Redmi Note 3 is the champion in this 11K shootout in our opinion. Of all the phones we tested for this shootout, the Redmi 3s Prime felt the most comfortable to hold. It might just have a 720p display, but it is still comparable to other 1080p displays in this price segment, in terms of colour saturation and viewing angles. Xiaomi hasn't tinkered with the design much and gone with a similar design to the Redmi Note 3, making the two phones easily recognizable.

The Redmi 3s Prime is able to win the best buy because of its performance and the price at which it achieves that. The small phone blasts past everything in the segment and just stops short of the Redmi Note 3. In addition, the 4100mAh battery on the phone just

won't die in a day, making this one of the most affordable smartphones on which you can play Pokémon Go without being concerned about the battery. As for the rear camera, it does a decent job but it's still not as good as other contenders around the same price point. Still, under 11K, considering all parameters in mind, the Xiaomi Redmi 3s Prime will provide the best value for your money.

Best Performer Xiaomi Redmi Note 3

Going through all that data, it is quite easy to assess that the Xiaomi Redmi Note 3 is our best performer in this shootout. It scores top scores across all synthetic benchmarks and its real life usage reflects that. The phone can outperform smartphones way over its price range, thanks to the Qualcomm Snapdragon 650 SoC. In addition, heating issues have been kept in check and even when we played games on the phone for prolonged period, the temperatures never went too high.

Performance aside, the Redmi Note 3 is also able to achieve the best overall scores in this shootout. A major chunk of this scores is attributed by the battery life, which is quite simply the best you can get in the sub-11K segment. The display is quite good and even though it is a little on the cooler side, it is able to do justice to the image on screen. The looks of the phone are a little too conservative and Xiaomi could have done a better job with the 16MP rear camera but overall, you won't get a better phone in this budget.
