Q New gaming rig

Hey Digit overlords, I am sick of gaming with my Dell laptop with the integrated GPU. I went through the worst and completed AC, BF4, Watchdogs etc. Poor me! So I decided to build a PC and used your killer rigs as a template. But to my surprise most of the components were overpriced online. So, I started customising them to suit my needs and my budget. This is my config so far:

- MoBo- Gigabyte G1 Gaming 5 GA-Z170x
- CPU- Intel Core i5-6600 FCLGA 1151
- GPU- Gigabyte GTX 1070 G1 GAMING
- RAM- G.SKILL Ripjaws V Series DDR4 1x8GB
- SSD- Kingston SSDNOW v300 240GB
- HDD- WD BLACK 500GB
- PSU- Seasonic M12II-750-EVO

Please try to confirm the compatibility of these components with one another. I have a full HD TV to use as a monitor and 5.1 home theatre system for audio. The thing is, I need a good cabinet for my PC under 10k. I can stretch it a bit if the need arises. Also suggest me a good monitor under 20k for the future.

– Vishal

A Hey Vishal, we're happy that you're building quite a powerful gaming rig, which will be able to run almost all the high-end games in maxed out settings. Although we have a few suggestions from our side. The i5-6600 isn't an unlocked skew so you won't be needing a Z170 motherboard and you can go for cheaper H170 or B170 boards. If you're interested in over-clocking your CPU only then you should go for the Z170 board along with an unlocked CPU such as the i5-6600k or i7-6700k, but you will need to buy a third-party heatsink. The Kingston SSDNOW v400 is an upgraded version of the above mentioned SSD that you should consider. We don't know the model of your TV but usually their refresh rate is locked down to 30Hz so you won't be able to

get the sweet 60fps count in games. Check it out, then you could try looking at the BenQ RL2755HM monitor which fits your budget. Coming to the cabinet, there are a lot of options to consider under the 10k price category. If you are looking for modularity then the Cooler Master MasterCase Pro 5 is a great option for future upgradability. If you want a clean and silent case, we would recommend the NZXT H440.

Q Repaired or new laptop?

Hi, I have an Inspiron m5010 laptop which is 5 years old and I'm having a lot of problem with it. So what should I do? Sell it and buy a new one or buy new hardware like the motherboard inside. If I should buy a new one, can you suggest something under ₹60,000. Otherwise, where should I get a motherboard? Please specify. Thank You!

– Siddharth

A Hi Siddharth, if a product gets older than 4-5 years, then we would recommend you to look forward to buying a new one. The main reason is the discontinuation of components from that particular model, making it difficult for repairs. You have a decent budget for a powerful laptop and we do have a few suggestions falling under it. Among the laptops we have tested, the 13.3-inch Zenbook UX305FA is great for portability. But if you want a more powerful laptop and can compromise on portability, then you should definitely go for the Lenovo IdeaPad 500 (review up in the Bazaar section).

Q D5500 or EOS 700D?

I have a budget of 50k. I shortlisted the Nikon D5300 and D5500 (double lens) and in Canon, the EOS 700D. Which DSLR should I purchase? Please advice.

– Anshul

A Hey Anshul, between the D5300 and the D5500, it definitely is the D5500. The Canon EOS 700D is quite an old DSLR and although both have the same sensor, the D5500 has a 24MP sensor while the 700D has an 18MP sensor. There are several more

points to consider buying the D5500 such as more focus points, better ISO performance, longer battery life and it's comparatively lighter than the EOS 700D. You'll be able to pick up the D5500 for less than 50k with the basic 18-55mm VR II kit lens.

Q AMD vs. Intel

Hello Digit team, I'm a die hard fan of you. I was already interested in gaming and now, inspired by you, I am building my own gaming PC. The components I'm going to buy are:

1. AMD Vishera FX-9590 8-Core 4.7GHz Socket AM3+ (Black Edition)
2. Kingston FURY (8GB x2) 16GB Module - DDR3 1866MHz
3. MSI 990FXA GAMING MotherBoard
4. 1TB Internal Toshiba Hard Drive SATA
6. 750 Watt PSU
7. Gigabyte Radeon RX480

Now I want to know why do you recommend Intel i7 processors instead of AMD in the high and ultra-high end gaming rig. Because AMD processors come with more clock speed at cheaper rate. And if Intel is good then I'm going to buy i7-6700k. So suggest me a motherboard (my budget is 15k) and a cabinet with awesome looks under 6k and DDR4 RAM (I want 16GB).

– Vedant

A Hey Vedant, why don't you check out our Killer Rigs section and find the appropriate configuration that suits your budget. We've made sure that we covered every budget range and included the best components. Looking at your config, we are guessing you're pointing to the mid-range gaming rig. All our recommendations in the killer rigs section are based on the best performing product under a particular budget. At the top end range, Intel's Core i7 processors perform the best compared to AMD processors, and there are other factors that affect the performance than the clock speed. Under 6k, we highly recommend the NZXT Guardian 921RB cabinet. Refer to the killer rigs section for the motherboard and RAM. **Q**
