

tab on the bottom right of a Compose or Reply window. Here you can create responses and save them for later use.

Backing up Gmail messages offline

Are you tired of hearing someone in your company lying about deleting their emails without backing them up? Well, it's time that they were introduced to Gmvault. Not only does it download all your emails to your hard drive, but you can set regular

Use canned responses just like preset texts on your phone

backups and even specific search term related email backups at your end. A console-based application, one helpful and interesting feature also included is being able to restore all your emails to a different Gmail account. There are several manual steps and configurations required that can be found here: <http://digit.in/Gmvault>.

Mark as read button

The unread mail counter can make some people paranoid and in order to make it easier for them to get rid of it, the 'Mark as read' button is the solution. Available under Google Labs, users will have to go to Settings > Labs > Mark as Read Button. After you save and return back to your inbox, selecting the checkboxes of emails invokes the 'Mark as read' button on the top bar. This drastically decreases the time required to go through the unimportant emails that need to be read just to get rid of the counter. If you don't use it already, go do it now!

Unsend an email

Ever sent out an email in a fit of rage? Or pushed the send button too soon before noticing a career breaking typo? Gmail offers an 'unsend' option that is disabled by default. If you wish to enable it, head over to Settings > Undo Send and enable it. This allows Gmail to hold your email for a short while, the duration of which also can be selected in the option, before it actually sends it out to the recipient.

Avoid typos and correct your grammar:

It's not really a pleasant site to watch an embarrassing typo ruining your long and well worded reply. Grammarly's extension (<http://digit.in/GmrmrlyChrm>) ensures you don't have to go through such a moment by taking over any text area in the browser. You'll also get recommendations for grammar errors.

Check for suspicious activity

It's always safer to log into your Gmail account from trusted machines and networks. If you're slightly paranoid about suspicious activity occurring in your account, Gmail has its own tool to monitor such intrusions. By scrolling down while in your inbox, head over to Last account activity > Details. On a different window, all the instances will be listed including the access type (browser, mobile), IP address, country and time. Out of all the instances, if you

Track all the logins for your account

Add another email address right within Gmail

happen to notice any weird connections, the next step would be to hit the 'Sign out all other web sessions' button and immediately change your password.

Add other email accounts

Did you know that you could add other email accounts right inside Gmail? The only restriction is POP3 and SMTP email accounts and they can be added from Settings >

Accounts > Check mail from other accounts. In order to get started, first you need to acquire the POP3 details for your domain's email address. Now, in order to send mail from Gmail, you'll need to add your SMTP details. These details will be verified with your mailing server by an email sent to your domain email address and from here on, you'll be able to access your domain email address right inside Gmail.
