STREAMLINING TEAM COLLABORATION

We tried out a bunch of team collaboration tools so that you don't have to...

Abhishek Balaji

Communication apps are a dime by the dozen. Once a niche market occupied by the big tech companies of the 90's like Microsoft and Yahoo, it's impossible to catalogue all of them. Rummaging through the near similar features of all of them, it is a struggle to find those small features which distinguish one from another. Every messaging app promises the same – better communication, faster connection, file sharing and easy collaboration. So, which one is the best one for your team?

Why online collaboration?

Starting off, why would you need a collaboration app? What's wrong with traditional methods?

Traditional methods of collaboration are very fragmented. Each person in your team might be used to a different app for messaging, a file collaboration service and email. Collaboration apps create an ecosystem for work which integrates all of these. They are able to integrate with other services and apps as well. Apps like Slack, Asana, Trello and many others do everything, but specialise in one thing.

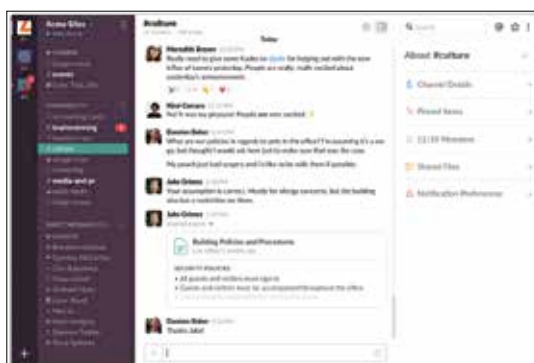

Slack

Slack, for instance, is a concept derived from IRCs or Internet Relay Chat

services which used to be the most popular services for instant messaging on the internet in the past. IRCs were often complicated to set up, administer and manage and it became difficult to block out spam once the bots took over. Other messaging platforms faced similar problems too. When people began to realise that traditional messaging services weren't going to cut it they reverted to email. Email has its own set of problems. Most organisations had to invest quite a bit in email servers to get good experiences or had to put up with bad interface design and reliability. A person belonging to multiple teams or organisations often found it difficult and cumbersome to keep switching between work and personal emails. That is when Slack was envisioned. Slack is meant for all team sizes, from a small five member struggling startup to a very large organisation valued in billions. It is very easy to scale and works with existing services. The pricing structure of slack is also very convenient. It provides organisations with flexibility in billing and managing workforce in the team by billing per user and how they use it. Slack also detects when some employees are inactive and stops billing the organisation for those. For

a typical organisation with average usage, slack would work out to around \$5 a month per employee, which is much better economically than paying for multiple services or dropping a lot of cash in developing a custom solution. A service like slack also takes the pain of manually maintaining and upgrading the service. It lets you concentrate on the working alone and eliminate the pain of setting it up.

After a rather uninteresting launch in 2013, Slack has added a ton of features to its kitty like video conferencing, the long awaited integration with Trello and the ability to make calls to other team members. It has also added a lot of billing options, including ones for non-profits, enterprises and custom solutions for very large companies. While most other collaboration software aim to stand out by offering distinguishing features, slack is going in the opposite direction by aiming to integrate all

Slack has a lot of features integrated inside

services into one platform. It is worth noting that slack has one of the best customer support teams on social media.

Podio

Podio on the other hand is a completely enterprise-based platform. It is targeted at enterprises working on a lot of projects. It has a lot of features focused on users who'll be creating and sharing updates with the rest of their team. Podio works for organisations which use a lot of project management tools like calendars, tasks and work assignments. Podio doesn't do messaging very well, so if you're expecting to chat with your office mates well, you'll be disap-
