

Perchang

Ever been fascinated by one of those elaborate setups at a science centre where shiny metal balls are guided along a track made of twists and loops using physics and a little ingenuity? If you loved staring at those and trying to work out how they functioned, you will love Perchang. The game is about guiding a number of marbles from a spout which ejects them to a hole where they are collected. This sounds simple enough until you factor in the variety of tricky obstacles the game throws at you. In each level, there are two buttons, red

and blue. The red one controls everything red in the level while the blue one controls everything blue. The coloured bits in each level range from simple levers to fan or wheels and even teleporters. Sometimes there are more than two counters to fill and you'll have to work out a way to achieve the target without losing too many marbles.

The game is beautifully designed in shades of grey where the movable parts stand out. The cheery soundtrack makes the game that much more enjoyable. The game is free but there is one in-app purchase of Rs.85 to remove the ads which pop up. There are 12 stages with 5 levels.

Depending on how fast you are, you will be given a gold, silver or a bronze medal. The game is a must for puzzle fans as this is especially well made. However, the experience of playing the game might be marred by the fact that it lags a bit, even on higher-end devices. However, after a few trials, you should be able to get this game to run smoothly.

Poly and the marble maze

Poly and the marble maze is about a ball on an epic quest to jump over some blocks, collect diamonds and capture the flag. Think of it as an adventurous golf ball which decided to fight the Man and complete the holes all by itself.

The game has been designed taking inspiration from the 'Monument Valley' school of design where the surrounding landscape stretches on forever with simple colours. However, whereas in Monument Valley the focus was on understanding the different perspectives in each level, Poly and the marble

maze is more about control and accuracy. You drag anywhere on the screen and tap to jump. There are three sections with twenty levels each.

Unlike other games like this which have platforms which hang in midair, there is no way to stop the ball from going over the edge. In the first few levels, before you have a firm grasp of the controls, the ball will just slide off

the platform and into the abyss below. The soundtrack isn't worth speaking of, which is okay because the silence allows you to focus on controlling the ball to reach the goal. It is more of a challenge than the average mobile game but worth playing precisely because of that.

Light House

Light House takes its name rather literally and has you transmitting light to a lighthouse so it can light up the way for lost seafarers so they don't crash headlong into the rocks. The levels start easy and new elements keep getting added to the

gameplay as you progress. The objective of the game is to align these elements (which are mirrors, primarily) so there is a clear path for the energy to get to the lighthouse. Each lighthouse has a required amount of energy that it needs to complete the level.

The puzzle requires an intuitive sense of physics and direction and most importantly an acute sense of timing. The levels don't remain static for too long and soon you will find obstacles which just keep moving moodily up and down. If at any time the path of the energy is obstructed, it is lost forever and you have no option save to try again. Certain parts might irk you a bit if you love physics, like where you move mirrors while the light

is moving to direct it along the way. This means that you are moving faster than light which is magical or absurd depending on how you look at it. The game has 9 packs with 6 levels each and the ninth pack is still under development. The game makes the use of slick isometric design which is quite pleasing to the eyes. There is no soundtrack except the sound the energy makes as it drips into the lighthouse. There is no tutorial as such and the initial levels take care of explaining the basics to the player. Newer twists are explained when you come across them. Light House is completely free and devoid of any in-app purchases and is a must-try if you like well-designed puzzles.
