Making great videos doesn't really need fancy and expensive gear. just the right tricks up your sleeve.

# TO MOCK IS DIVINE

Here are epic fail reactions to technology brands' attempts to woo everyone gone horribly wrong

Meghana Gupta  
readersletters@digit.in

In the 21st century, creativity is all but a misnomer. Nothing is original, you see. So, there are certain similarities between global brands and their Indian counterparts. Take, for example, Whatsapp – a free messaging app that is available for Android and iOS phones globally.

An ambitious entrepreneur might come up with, say, Hike. Which, as you might've guessed, is also a free messaging app. Another example would be how Ebay spawned OLX, Quikr, or a spate of other online sales portals. Nowadays, brands spend hundreds of millions of dollars trying to come up with an iconic logo change, or new innovative technology. Sometimes though, they should've just copied.

## What the what

**01 Uber logo re-design:** Before this particular redesign, Uber had a perfectly serviceable logo. While it wasn't aesthetically gorgeous, it was fulfilling the chief requirement a logo has – to be recognizable all over the world. Let's be honest, it is quite literally a 90 degree counter clockwise inversion of their previous logo. Predictably, social media went mad.

A spatula is hardly a logo for a taxicab company, right? Or perhaps they took inspiration from Star Wars? Probably not.

Of course, a press release came out almost immediately, explaining how this new logo is essential to the realignment in the brand priorities. Something about 'bits and atoms' inspiring such a logo. That might very well be so, but when your new logo resembles a badly done henna tattoo, there might be something wrong.

This was broadly hailed as an absurd decision. But then again, it isn't close to as absurd as compared to some of the others in this list.

**02 Google Glass:** This piece of revolutionary technology first came up in 2012, and was available to the public in April 2014. If you were lucky though, you could've been one of the lucky few who beta tested it for a knockoff price of a mere \$1500. It's groundbreaking features include being able to take photos, shoot videos, and err.... Google stuff. That's about it. If you were paying \$1500 for a pair of glasses, the least you could expect is a Cyclops style laser beam obliterating your enemies. Or just fulfill the primary purpose of a pair of glasses.

To people saying that Google Glass is just a phone taped to your face – that
