COMMUNITY CREATIONS

Ishan Gupta

About the creator:

Ishan Gupta is a thirteen year old developer from Kanpur, UP, who is really passionate about Android development and coding. When he isn't in his geekiest form, he also enjoys sports and music. Devoted to whatever he does, Ishan doesn't believe in quitting until he achieves his goal. He receives

complete freedom and support from his family and teachers, and also looks up to the stories of successful people. With an immense interest in computers right from the sixth standard, he found an interest in coding through his seniors in school and never looked back. Ishan wants to study in the best institute and become a successful software engineer while earning respect and fame. In the future, he also intends in starting his own company to develop software and games.

About his creation:

Ishan got into Android game development after reading several blogs. With some tinkering in the Unity game engine and further learning about the software through forums and video tutorials, he managed to learn unityscript and came up with the concept for a game. He ended up developing Colorman, an endless runner game and published it on the Google Play Store. He dedicated his inspiration to successful people in the field of game development. You can download it from here: <http://dgit.in/Colorman>

Adding objects that follow elements present in the video.

You can actually do a lot with this one – imagine adding various 3D models in your video, or even a full fledged creature!. But for now, let's consider you want to add text that stays relative to some object in the video. To achieve the same, open up Adobe After Effects and import the footage, crop the active work space to the area which will have the text. Then go to Animation> Track Camera. Leave it for few minute and it will analyse your footage and at the end, it will generate numerous tracking points on the video. Just for a check, play the video and you will see that those points 'stick' to their specific locations and when you mouse-over any of the points, a circular disk would appear.

Go through a few point and choose any one of the point whose circular disk looks to be in correct orientation with ground or wall. In other words, imagine how a disk would appear from the viewpoint of camera to that point, and then choose that point which has a disk with real-life-alike orientation. Click on that point and choose "Create text and camera" which will provide you with a text that will follow that point. And there you go! Just edit the text and it will stick to that point. However make sure that the footage is pretty clean - that is, it should have fewer moving objects and should not contain any jitter. These effects discussed above can be seen in action in a 20-second-long video clip at <http://dgit.in/TextVFX>

Lighting

Every setting can have different lighting; However, in general, use a diffuser (this basically softens the light). Alternatively, you can use a white chart paper as a 'softener'. So the light directly hits the chart paper and then towards the object. If you don't even have a chart paper, then use the wall next to you. Just never let the light directly hit the object which will end up by producing a harsh light on object and you won't like it, unless you actually want that look.

After lighting the object appropriately, you would also need to take care of the environment which would be out of focus but is still relevant. In the environment, remove the objects that are distracting and prefer a clean environment because you want the audience to look at the object and not the background. Consider checking out examples of bad and good lighting to get a better grasp of this.

With all these tips, you've got a good head start in film-making. Look at the works of great directors and evaluate how they transition audio or maybe how they lighten the scenes. I'd also recommend you to start watching Casey Neistat's vlogs (on YouTube) which has great content and the way he tells story is just perfect! Above all, have a clear story and narration, the equipment would never limit you from creating a masterpiece. 📺
