

Mission for pre-order

Nixon Mission is the most rugged smartwatch we've seen and it's priced at \$400. <http://dgit.in/NxnMsn>

Epson's pro projector

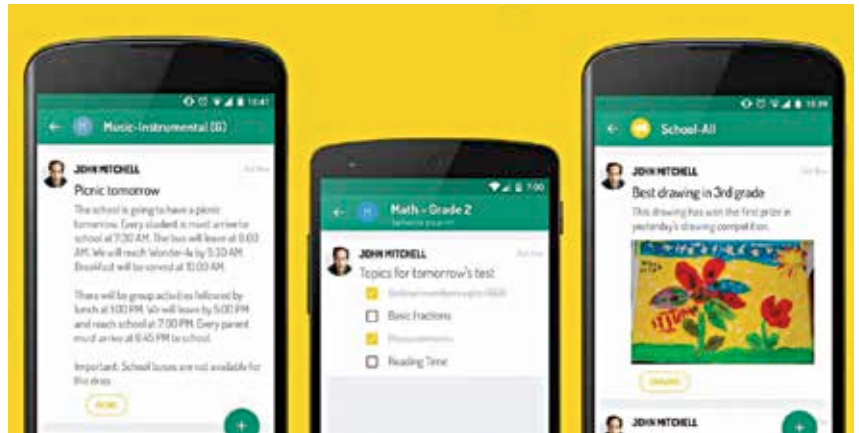

The Pro Cinema LS10500 Projector comes with 4K and HDR support. <http://dgit.in/EpsnProProj>

Feature

content on apps is chosen by the developers for a specific target audience, and along with that a number of such apps come with quite a few useful and innovative features. As Mr. Jairaj Bhattacharya, MD, ConveGenius puts it, "Parents are choosing to provide digital devices to children. This is because children are exposed to gadgets like smartphones for entertainment and games anyways. If these gadgets could further learning outcomes and improve them psychologically, it serves as a win-win for the parent and the child. Also this serves as a great approach to fill the gaps that working parents face today due to lack of time towards their study."

While there are quite a few apps that directly help the education of a child, there is not much parenting involved in those other than installing the app and probably choosing a subscription plan. Take Vedantu, for example. The online tutoring platform is highly effective in its one-on-one tutoring method, but does not provide any option for the parent to monitor the child's progress without taking over the device themselves. Of course, the content on Vedantu starts from the 4th standard, but that doesn't mean that it wouldn't benefit from taking parents into the loop in a better way.

On the other hand, services like Uolo are trying to connect Parents, Students and Teachers on a common platform. Uolo is a Parent-School communication platform that aims to bring important information as well as small tidbits to all parents, simultaneously. Essentially a one-way messaging app, it allows the teacher to create groups of students on the app, and when a parent installs the app and logs in with credentials from the Uolo team, they can receive the messages sent by the teacher on the group. This aims to involve parents better in the schooling process. They have Android and iOS apps, a desktop website, and an SMS service. And it's not even the only offering trying to do this. US based remind.com and Mumbai based Knit App are also offering services that aim to streamline the communication between parents and students.

Parent teacher sync app Uolo Notes is currently working on Reminders and File Attachments

Appystore.in is another platform that focuses on providing good quality video content for kids of various age groups between the age of 1.5 to 8 years old. Content on the platform is filtered by age group and a parent can track the progress of their child based on videos viewed. A survey by Appystore, conducted with over 1000 parents across India, reveals that 58% of parents agreed that digital learning helps children learn new concepts. "Only 5% of the preschool population are enrolled into a preschool. Hence, what is regarded as the most important developmental years for a child gets no guidance in India. As such in the absence of strong offline infrastructure and availability of digital options is making newer generations look towards the internet and digital to satisfy the need for parenting support and information," says Mr. Manoj Barot, Director Marketing, Appystore.in.

But education comes at a much later stage in a child's life. New and expecting parents have a lot more to deal with, and with nuclear families soon becoming the only type of families out there, they don't really have a source of trusted experience based information. And when it comes to advice, almost every other person recommends something completely different. So

when BabyChakra launched in 2014, it had one goal in mind - to connect parents to the services they need, without taking any risks on the trust front. Ranging from expecting parents to parents of toddlers, BabyChakra allows parents to look for specific services like nutritionists, party planners, art classes and more. They can see reviews from other parents about any specific business on the platform and can also follow 'MomStars' on the platform, who are mothers who have signed up as experts on the platform.

A more comprehensive approach is offered by the My Child App. Available and used in 135 countries, this app regularly asks you questions about your child to track their growth between the age of 1-24 months and offers you advice in case it detects something unusual. It also connects you with doctors via an integration with Practo and lets you store all the prescriptions and reports in one place.

As you can see, Flintobox is filled with interesting activities
