

No Pro for Witcher 3

A number of games would be receiving updates to take advantage of the PS4 Pro, Witcher 3 will not make it to the list. <http://dgit.in/Wtchr3Pro>

iPhone 7's bugs

iPhone 7's new bug causes the to display 'No Service' on turning off the Airplane Mode. <http://dgit.in/iPh7Bugs>

– was so fierce that NASA's budget went to an all-time high in 1966. It was nearly 4.5% of the USA's total budget that year, and it has never been higher than 1.01% in the past 20 years. The very concept of space exploration reduced entire governments to a couple of kids fighting over whose toy is shinier.

You know that scene in the first Avengers movie where Tony Stark is asked when he became an expert in thermonuclear astrophysics, to which his response is, "Last night." Well, Elon Musk kind of pulled it off in real life. Technically, he was just a Physics and Economics double major and a Stanford

Learning from history, and why this incident is NOT a catastrophe.

The space race between the USA and the USSR brought with it its cost in human lives.

In January 1967, the Apollo 1 caught fire during a launch pad test. The three astronauts aboard all perished. These deaths temporarily brought NASA to its senses, and they decided to invest more time and make critical design changes to ensure safety. Later that year, the Russian mission Soyuz 1 ended with a parachute failure, and the cosmonaut Vladimir Komarov died upon impact with the ground.

in at least a partial success, which is a marginally better success rate than all other US rocket launches combined. Considering the fact that SpaceX's rockets can pull off the immensely complex task of landing back on the ground or at sea perfectly vertical, allowing them to be reused, the cost of each launch is already being slashed down dramatically by them.

Granted, Facebook and Spacecom, the two major interested parties in the Amos-6 satellite, will bear the brunt of the loss of equipment in the immediate future. But, as Mark Zuckerberg has said, Facebook has also been committed to developing technologies like Aquila, which are also aimed at expanding internet accessibility in Africa and other parts of the world. Also, as mentioned above, the routine nature of the risks involved in rocket launches means that insurance for the satellite was already in place. Of course, the intellectual and physical effort that went into making the satellite may be irrecoverable in the short term, but when you consider the fact that Elon Musk's to-do list includes "make humans a multi-planetary species by colonizing Mars with a million people by the next century", you begin to realize that this is not a game that is being played for the short term. Musk's tendency to be a "nano-manager" and his advocacy of complete vertical integration may have brought him immense success, but it is all done with a vision that is zoomed out a long, long way and is looking at time scales and humanity from an epic perspective.

This is not a catastrophic, institutional failure that will cripple the company. Far from it. A self-confessed "nauseatingly pro-American" nationalist, Elon Musk would see it as a betrayal of the American values if he saw this incident as anything other than an engineering problem to be solved – another hurdle to be overcome in the grand scheme of things.

There has never been – and I write this without any trace of irony – a more exciting time to be alive in the history of humanity. The sky is no longer the limit – there is, in fact, no such thing any more. 

The Falcon 9 rocket that delivered the geostationary satellite JCSAT-16 into orbit landed on a drone ship at sea. Rocket science isn't just getting one from the earth to space, which is already an extremely difficult engineering challenge. SpaceX is now also doing it all in reverse.

PhD dropout (after two days) when he decided to create SpaceX. But what his degrees failed to mention is that he was a machine, and he loved to learn. He spent one year consuming textbooks on the fundamentals of aeronautical engineering, rocket propulsion, and space launch systems. Jim Cantrell, SpaceX's first VP of business development, says that Musk nearly memorized the books he lent him, quoting passages from them verbatim. Additionally, Musk built a network of the leading experts in the industry so that the process was in the best possible hands.

Even in recent history, examples such as the infamous Columbia shuttle disaster of 2003 serve as a constant, grim reminder of the dangers of manned space flight.

However, to dismiss SpaceX as a failure entirely on the basis of this incident would be extremely naïve. The risk of failure is very real and very high with every single launch. To play up this incident as catastrophic for the company in the long run is to ignore what has been a remarkably impressive streak of successful launches. 27 out of SpaceX's 29 attempted launches have resulted
