

iPhone 7 scratch test

Apple suggests to to slap on a case on your Jet Black iPhone 7 and 7 Plus. Here's why. <http://dgit.in/iPhne7STst>

McLaren's new owner?

Reports suggest that McLaren, the supercar and race company may be bought over by a California technology group. Guess who? <http://dgit.in/McLrnOwnr>

Biostar RACING B150GT5

For the budget conscious PC builder

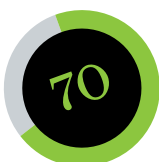

Price
₹10,200

This isn't the first Biostar RACING board we've seen, the Z170 RACING GT7 was the first and the Biostar RACING B150 GT5 picks up most of the features seen on the GT7. There's the fact that this being a B150 board, it's behind the Z170 in terms of features and CPU support, however, Biostar has made a few pro-overclocking modifications like including an LN2 mode

and multiple BIOS chips. However, the board doesn't have a lot of power phases (7 phases) compared to most overclocking Z170 boards out there. So stability will be an issue and there's also the fact that enabling over-clocking of Skylake CPUs on B150 disables certain CPU features like power saving C-states and Hyper-Threading. While we don't have as enough Skylake SKUs to test this out, this is a known issue so don't get a CPU with HT. You can do without C-states but losing HT is a big loss. Also, while there are two PCIe slots, this board does not support SLI or CrossFireX as the second slot has 4x lanes only.

The board's colour scheme is decent and the touch panel for power/reset/mode buttons are good. Given that most of the folks don't make use of the higher end features, a B150 board makes for a good choice since it's sufficient for the average PC builder. And the RAVING B150GT5 certainly packs in more of those features than a regular board.

G.SKILL RIPJAWS MX780 Gaming Mouse

Offers a competitive feature set

Venturing into the gaming peripheral space, G.SKILL has just the one

mouse and it's a pretty decent one. Featuring an Avago Sensor illuminated by laser, you can scale the mouse from 100 DPI to 8200. And the micro-switches are rated for 20 million actuations which is roughly twice of what other popular brands offer. The scroll wheel is completely open from the bottom which is great since it allows for easy cleaning and the rubber grip is smooth rolling. The positioning of the DPI switch is right where we like it and you can program the RGB LEDs to

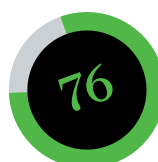

Price
₹5,429

indicate which DPI profile is active.

The mouse is ambidextrous with swappable side skirts but the two side buttons near your pinky finger are rendered cumbersome to actuate. The palm rest is screw adjustable so you can play around with it to get a comfortable grip. Since we are looking at customisability, you also get 2x 4.5g weights which sit between the mouse and the side skirt. We did notice that the PTFE pads on the feet have a tendency to collect lint which if not cleaned regularly will eventually slip in between the pad's adhesive side and cause it to peel off as was the case with the initial batch of Logitech G502. The main body of the mouse isn't easily serviceable which is a downer but the palm rest is accessible.

Performance wise, you can hardly make out the difference between the MX780 and the G502 and the Speedlink KUDOS RS all of which were used at around 800 DPI. Overall, the features of the mouse are quite competitive.
