While we wait for “true” wireless headphones to go mainstream, there will be a number of launches in the interim that have at least eliminated the more painful cable – the one that goes from your phone to your headphones. One such entrant is the MEE audio M9B – a fairly standard bluetooth in-ear headphone. It’s got quite a few accessories bundled with it like four sets of ear tips and a pair of behind the ear cable guides. In terms of looks there’s nothing to write home about. You have your standard rounded housing, a rather bulky control pod and a cable shortening clip. The housing is small and light which means that the weight of the battery has been transferred to the control pod – a good idea. The tips provided offer a good seal but you need to find one that fits you well. The bi-flange

one for example just didn’t cut it for me. On the performance front, the sound quality isn’t bad per se. On the contrary it’s quite decent except for the exaggerated bass. The boost on the bass end of the spectrum just makes everything sound hollow. The bass is overpowering and pretty boomy, to the point that the reverb gets overbearing enough to make it sound like distortion. Thankfully the clarity isn’t sacrificed. I’ll put the performance a little above the lower end iFrogz FreeRein Reflect we’d got some time ago. The sound signature isn’t anything like the iFrogz – those were bumped in the other end of the spectrum. It’s just that the deviation from neutral puts the performance score at the same level. If you are in the market for a wireless bluetooth in-ear and want added bass then consider the MEE audio M9B.

Brainwavz BLU-200

Incrementally better sounding than its younger sibling

The BLU-200 looks a lot like its younger sibling, the BLU-100. The housing, for example, is even larger this time around on the BLU-200. And while wearing them they protrude so far out, you can’t help but think of the Frankenstein monster with those bolts sticking out of his neck. The other difference is that on the BLU-200 Brainwavz has included a cable tie which lets you easily reduce the size of the flat cable that connects the two ear pieces. It’s a nice little addition and solves one of the minor niggles I had with the BLU-100.

In terms of performance the BLU-200 improves on two very important parameters: one is the connectivity and the other is driver tuning. The BLU-100 used to suffer from intermittent skipping and stutters when the

connection was lost. The BLU-200 holds on to the Bluetooth connection much better.

The sound signature this time around is decidedly bassier. The bass is tighter and more hard hitting as well. Most tracks I listened to sounded more spacious on the BLU-200. It does

better with multi layered tracks too. This is because the performance in the upper ranges isn’t sacrificed. You still have a certain amount of sharpness you need to ascertain detail. Vocals and upper mids sound a little recessed but only slightly. The BLU-200 is exactly ₹700 more expensive than the older BLU-100. I would say that this premium is worth it for the better performance. My only complaint still remains the battery life. Although slightly improved, it still remains rated at four hours.
