RDP ThinBook

Laptop priced under ₹10k. Seriously!

Price
₹9,999

Launched as India's cheapest 14-inch laptop by a Hyderabad-based company, the humble RDP Thin Book packs a 14.1-inch display that sports a resolution of 1366 x 768. The display is adequately bright along with a fairly average colour reproduction but reading text on this screen isn't very pleasing given the blurring around the text. Our review unit came with a plastic screen protection film hanging from the bezel which seems to be an production oversight we hope

this defect was just with our review unit.

Weighing 1.4kg, the plastic body construction is sturdy and would not flex or feel weak at any point. The screen bends backwards to almost 180-degrees.

PCMark 8 returned scores of 1364 in home test, 1433 in the creative test and 1185 in work test which are acceptable and cannot be complained for. However, all 3DMark tests could not run but the ones that did scored - Ice Storm (15,202) and Ice Storm Extreme (9,139).

There are dual downward-facing stereo speakers which aren't so great either as they're lacking clarity.

The ThinBook, owing to its 10,000 mAh Li-Polymer Battery, claims a battery life of 8 hours. PCMark 8 put it at 5.5 hours with maximum brightness and no Wi-Fi. However, we managed to run the machine for over 7 hours with mixed usage at 25% brightness.

With a handful of shortcomings, the RDP ThinBook is a fairly decent deal. So if you are looking for an economical laptop with a Windows 10 license then consider the ThinBook.

ECS Z170-LIGHTSABER

A step in the right direction

A while back we'd received the ECS Z170 Claymore which was positioned to be a premium gaming focussed Z170 motherboard and the ECS Z170 LIGHTSABER is another entrant in the same lineup with quite a few interesting changes. For a start, they've switched the LAN chipset from Realtek's DRAGON to Killer's E2400 which has undergone quite the improvement itself over the past year. The Lightsaber has more SATA and USB ports as well. Speaking of USB, ECS has 2 USB ports clocked at 1000 Hz for those who like to use gaming mice and

keyboard. While this is something that can be done via software

as well since most bundled software has this option, a little hand holding isn't bad. Another 2 USB ports have been marked as optimal for high power USB devices like VR headsets. The USB 3.1 ports continue to be Type A which we believe is optimal. While it may only mention AMD CrossFireX compatibility, the two PCIe slots run at x8 so you can have an SLI configuration on this board as well. And lastly, for those who like to spice things up, the LIGHTSABER does have multi-coloured LED so you can play around with the colours to suit your entire rig.

The ECS LIGHTSABER packs in pretty much the same set of features that you'd find with most other premium motherboard manufacturers and offers it at a much more affordable price point making it quite the attractive buy.
