

Jabra Halo Smart

Priced at ₹3499, the Jabra Halo Smart stereo headphones provide battery life up to 17 hours.

Drone Racing League

Professional Drone Racing League is really a thing now and can be now seen broadcasted on a TV via ESPN. <http://dgit.in/DrRngTV>

Mid-Tower Cabinets

HOW WE TESTED

Testing rig: To ensure consistency throughout the comparison, all the cabinets were installed with the same internal components. A couple of months back, we upgraded our test rig to make it more tasking for our review units. To be compatible with a wider option of components, we use the AsRock X79 Extreme9 motherboard. For the CPU, we used the beefy Intel i7-4960X (default clock speed of 3.6GHz) that pushes out a lot of heat from its six cores and to prevent it from frying up, we installed the Noctua NH-L9x65 cooler. The older generation of AMD GPUs generated a lot of heat, and hence we went with the Sapphire HD 7790. We could have gone for any compatible kit of RAM sticks, and we picked up two sticks of the Corsair Dominator DDR3 RAM modules (16GB) without any overclocking, running at 1866MHz. The PSU is an important component in your rig, and we use two different ones depending on the compatibility of the cabinet. To keep it fair, we use both a modular and non-modular PSU to check the ease of cable management possible. The Corsair RM1000x is the modular one while the Corsair HX620 is the non-modular one. For storage, we used the WD Red (2TB) hard disk drive and the SanDisk Extreme II (240GB) solid-state drive to cover the most common types of storage devices. The basic testing was carried out on the stock fans included in the cabinet so as to maintain the standard of testing them as it is shipped.

Once assembled, we installed Windows 10 with the latest updates and security patches on the SSD along with the latest Radeon graphics drivers for the GPU. The relevant benchmarking software were also installed, again with their latest patches and updates in place.

Performance test: In terms of cabinets, our performance tests were based completely on its cooling performance in the default setting. The default setting is the state in which the cabinet was shipped with stock fans included. Before running any benchmarking software, we let the system stay idle for 30 minutes. To measure the cooling performance, we use a set of benchmarking software to stress different components. Prime95 puts an immense amount of load on the CPU while generating a lot of heat, and the same is achieved by FurMark on the GPU. We note down the temperatures by running Prime95 for 15 minutes in the default setting whereas for FurMark, we run the 1080p preset benchmark with burn-in switched off. For storage devices, we put them under stress with more of a real-world test by moving the Steam backup files for GTA V back and forth between the HDD and SSD. The temperatures are noted down using Speccy. Apart from these benchmarks, we test the assembled system with casual browsing, image editing, word processing and also play a few games. If anomalies are observed, the benchmarks are run once again. One aspect we couldn't test was the sound levels generated inside since we don't have the necessary equipment. Hence, the entire comparison is to be treated as exclusive of noise performance.

Features evaluation: It's impossible for every cabinet to have the same set of features. In our comparison test, we came across unique features, in every cabinet, that have been considered. We've made sure that these unique features don't make the comparison unfair by assigning them a low weightage in the final score. Under the features evaluation, we've considered the

degree of modularity available and also the ease of cable management. Modularity covers several aspects such as removable or detachable components, tool-less design and upgradable parts. For cable management, there is an aspect of subjective scoring pertaining to how easy it was to route and arrange the cables to achieve a neater look and better airflow.

Build quality: The build quality of the cabinets are based on the materials used in the various parts. It's kept entirely objective, by scoring the cabinets solely based on the types of materials used for different segments, thickness and efficacy of the same, and further distributing them with a fair weightage. For example, the use of steel is given a higher weightage than plastic parts.

Final verdict: Here, we'll try to define the awards that we present according to the scores obtained. It includes three awards, where the Best Performer goes to the one with the highest score achieved in terms of cooling performance only.

The Best Buy award goes to the cabinet with the highest performance/rupee ratio. Do note, here the performance includes cooling performance, along with the scores for features and build quality evaluation. If a product happens to lack high-end features or build quality but has a lower MRP, the value for money score is automatically compensated to keep it fair.

Editor's Pick goes to the cabinet that misses out on both the above mentioned awards but is still worthy of being mentioned because of a few extra or unique features. This award is completely subjective since it's highly dependent on the reviewer's experience based on the time spent tinkering with all the cabinets.

design. The camo-green plate and yellow accents on the front panel show off the true military colours while the naked top panel depicts the crude sense of regular military gear. With more drive bays than you need, you

just get support for a 240mm radiator on the top panel. You don't get any level of modularity compared to the others, and this is quite the case in the mid-range budget segment of cabinets, so we aren't complaining. Due to its small

size, we were able to comfortably route the cables from a non-modular PSU and it was far easier with a modular PSU. It also features a fan controller switch if you're habituated to lower or pump up your fan speeds.

Even if you don't spend time in cable management, and find it tiring, the protruded side panels easily accommodates the excessive cables. Another advantage of the protruding side panels is that you will be able to
