iPhone 7 accessories

Here are the best adapter & dock accessories available for the iPhone 7 and 7 Plus. <http://dgit.in/iPh7Acc>

Antec GX900

install in a 170mm long CPU heatsink. This is really good because it's a small cabinet, and you'll also be able to install a GPU of a maximum length of 310mm. If you want to have a mean looking machine at home to reflect your toughness through the military theme, you could go with the GX900. In terms of performance, only if you populate all the fan slots or add a radiator on the top, will you be able to achieve better cooling inside. With its stock fan setting, the cooling performance is below average comparatively.

CORSAIR CARBIDE SPEC ALPHA

The design of the Spec Alpha is highly reminiscent of the turrets from the video game Portal, and with the front and top panel angled design, this is the best looking cabinet in the comparison test. If you're only concerned about showing off your cool case, this is the cabinet for you, and because of the window panel, you'll

also be able to show off your internal components as well. The front panel allows the expansion of another 120mm fan along with the already installed two 120mm fans. One disappointing feature about the cabinet is radiator support since it's restricted to only the front panel with a maximum length of 240mm. The top panel supports two

120mm fans but there isn't enough room to accommodate a radiator. If you're ready to give up on the drive bay, then only will you be able to install the radiator at the front. Two SSD brackets can be found behind the motherboard plate, so you don't need to worry about storage but you won't be able to install any 3.5-inch HDDs.

The three-speed fan controller on the front panel is a convenient feature if you're keen on saving power and toning down on the noise levels, when you aren't doing any system heavy task. Replacing the stock fans with aftermarket coolers and radiators will require you to remove the drive cage. The same has to be done if you intend on installing a second GPU (310mm in length). Although there are a generous number of tie-slits and paths for cable management, we faced trouble while routing the CPU power cable through its corresponding cutout. The meshes on the top and front panel don't have

any dust filters and you'll find one only at the bottom. The bottom line in this comparison is that performance wise, the Spec Alpha is strictly average. Nothing is impressive including all the aspects of cooling, modularity and cable management, except the design.

COOLER MASTER MASTERCASE MAKER 5

Among the cabinets in this comparison test, the Maker 5 has the best build quality we've observed in every single part of the chassis, with no visible flex at all. Being the top-end model in the MasterCase lineup, it was expected for the company to go for a glass window panel since they do have a tempered glass window panel selling separately. But they preferred an acrylic one like almost everyone which is susceptible to scratches. Routing your cables is not just easy but it's fun to tinker around with the numerous tie slits and slots provided on the motherboard plate, just to stuff the thick cables. Along with cable tie slits, the company has also installed Velcro straps, making it super convenient and good-looking rather than tying them down using crooked cable ties. The PSU shroud houses the PSU, and a removable module of two drive bays, with enough room to store long cables. We would recommend the front I/O panel cables to be bundled together using the 3M tape cable clamps (included). All the drive bays inside are removable and we opted for one of the two SSD slip-and-click trays right on top of the PSU shroud and one of the HDD trays in the bottom-

Corsair Carbide Spec Alpha
