

Access Drive easily

Outlook on web now supports using Google Drive files within Outlook directly. <http://dgit.in/GDrveOtlk>

Note 7 recall

Below 15% of Samsung Note 7 sold have been returned, according to reports. <http://dgit.in/Note7Rcl>

Mid-Tower Cabinets

Cooler Master
MasterCase Maker 5

mounted bay. This configuration enables you to insert a 280mm radiator on the front. The front and top panel both snap right on to the cabinet using magnets.

Inside the case, a full ATX size motherboard will take the entire space of the motherboard plate and leave hardly any space above the PSU shroud. This makes it difficult to install another SSD in the tray on the right since the USB 2.0 header comes in the way. The padded front panel manages to keep the cabinet silent and the same can be said for the top panel. It comes with a single-colour LED strip but in the age where even mousepads have RGB lighting, they should have built and shipped an RGB strip. The MasterCase lineup has a lot of additional accessories for the cabinet that can be bought later according to your preferences including a tempered glass window panel, GPU holder, extra drive bay modules, etc.

NZXT H440

Not everyone is paranoid about the noise generated by their components in their rigs. But if you are, you might have already heard about the H440. The panels of the cabinet are lined with a layer of silencing foam, in order to suppress the noise generated from the fans and radiator pumps. The foaming efficiently covers the inner sides of the top and front panel, along with the side panels. The cabinet includes some quirky colour options, and even a special edition manufactured in collaboration with Razer. The front and top panel have a really interesting design, and although the paint job might not be suitable for some, the new and upgraded edition of the H440 includes a matte finish. A super convenient PWM fan controller hub is found behind the motherboard plate, capable of powering up to eight fans. This is useful if you plan on adding more fans inside, eventually running out of fan headers on

the motherboard. But there's a downside to the hub since the foaming near the hub wears out, and it doesn't look pleasant. Like the Spec Alpha, you won't be able to add in a 5.25-inch ODD drive inside the case, and you'll have to depend on an external DVD drive. Speaking of storage support, the H440 can accommodate a crazy number of 3.5-inch HDDs (a maximum of 11) and two more SSDs right above the PSU shroud, the maximum any of the other cabinets can support. The drive bays can be easily removed but their locking mechanisms aren't the best we've seen. It would have been great if the entire drive cage could have been removed. In this configuration, one could have used both the SSD slots and the HDD slot inside the PSU shroud.

The gap between the motherboard plate and the side panel isn't enough to hold the thick cables. This also results in the protruding cables leaving marks on the foam layer, making it look

uglier. But a neat level of cable management can be achieved with this case by stuffing all the extra dangling cables in the shroud. Tighter loops can be created with the cables, and thanks to the generous number of tie slits and cutouts, you will be able to achieve good cabling easily.

THERMALTAKE CORE V51

The biggest cabinet in the comparison test, Thermal-take ensures that you don't have to fret about cooling expandability in the future with the Core V51. Right from supporting fan sizes of up to 200mm on the front and top panel, the cabinet also supports huge 420mm radiators on the top and front panel. Evidently, the top and front panel have immense support for all sizes of fans and radiators, making it highly flexible to go for several cooling solutions, even setting up reservoirs for liquid cooling systems. All the drive cages can be removed which makes it possible to take advan-
